

# STORMWATER MANAGEMENT REPORT

Prepared For:

215 Foreside Road, LLC  
40 O'Brion Redevelopment  
40 O'Brion Street  
Portland, Maine 04101

Prepared By:

Acorn Engineering, Inc.  
158 Danforth Street  
Portland, Maine 04102

March 2016

## INTRODUCTION

Acorn Engineering, Inc. has been retained by 215 Foreside Road, LLC to provide civil engineering services for the proposed redevelopment of 40 O’Brion Street. The proposed project is a residential 3-unit redevelopment of an existing vacant lot. The lot is currently used as a side yard by the adjacent property which is also owned by 215 Foreside.

A stormwater analysis will be prepared to demonstrate that the project will meet the following requirements of the City of Portland (the City):

- City of Portland Land Use Ordinance Chapter 14, Article V. Site Plan Section 14-523. Required Approvals and Applicability (F) Level III Site Plan Review.
- City of Portland Technical Manual – Section 5 – Portland Stormwater Management Standards and Maine DEP Chapter 500 Stormwater Management.

The proposed project will include the redevelopment of existing, grassy pervious area. The current course of action is to provide water quality treatment to the stormwater through infiltration utilizing a Maine Department of Environmental Protection – Infiltration Trench approved stormwater Best Management Practice (BMP). This development shall incorporate green infrastructure to provide water quality treatment for no less than 95% of the new impervious area and 80% of the developed area.

The project will result in a net increase of impervious area above 1,000 sf, as such, the project is required to include stormwater management features for stormwater quality & quantity control. The stormwater analysis is documented with supporting calculations and reports attached to this narrative.

## EXISTING CONDITIONS

The proposed project site is located off of the Eastern Promenade just after Hanson Lane. Portland has zoned this area as an R-6 Residential Zone. A boundary plan has been prepared by Owen Haskell, Inc. of Falmouth, Maine dated March 3<sup>rd</sup>, 2016.

Abutting Uses:

➤ North	R-6 Zone	Multi-Family Residential
➤ West	R-6 Zone	Multi-Family Residential
➤ South	R-6 Zone	Multi-Family Residential
➤ East	R-6 Zone	Multi-Family Residential

The project area is previously undeveloped with minor landscaping details including stone walls and young sapling trees. The site is relatively flat with an existing grade of approximately 2% that slopes from south to north. The project area presently drains towards O’Brion Street before entering the municipal storm drain system.

The project team is not aware of the presence of any existing significant natural features located on the site. Given the urban setting, and existing free-draining soils at a high point

on the peninsula, a field inventory of significant natural feature was not undertaken. The project is not located within a watershed classified as an Urban Impaired Stream.

### **PROPOSED DEVELOPMENT**

The proposed project is a residential 3-unit redevelopment of an existing undeveloped lot. The existing site has been recently landscaped to include a series of stone walls and small, newly planted trees with DBH at 4" or less; the adjacent property that utilizes this side yard is also owned by 215 Foreside.

To minimize the development's footprint and impervious area the project will include four (4) covered parking spaces with space allocated for bicycle parking and solid waste/recycling storage. The walking paths and portions of the driveway will also be comprised of pervious pavers to allow for stormwater infiltration.

The development will be served by the Portland Water District, underground power/cable/communications, natural gas and the municipal sewer system. The project anticipates incorporating Maine DEP approved stormwater Best Management Practices to meet the General and Flooding Standards.

### **GENERAL STANDARDS - WATER QUALITY**

The development shall provide water quality treatment for no less than 95% of the new impervious area and 80% of the developed area. The project includes the redevelopment of existing impervious, undeveloped area and will therefore be adding new impervious surface to the site. Water quality treatment shall be provided through the use of an Infiltration Trench meeting the specifications of a Maine DEP Infiltration BMPs.

The Infiltration Trench was sized to meet or exceed the requirements set forth within the MDEP Volume III: BMPs Technical Design Manual Section 6.0. Infiltration BMPs have been shown to be very effective at removing a wide range of pollutants from stormwater runoff.

The majority of the impervious area is from the roof. The stormwater runoff from the roof and driveway shall be directed into the pretreatment catch basin acting as a sediment trap. The catch basin distribution pipe will include a hood or trap on the inlet commonly referred to as a snout or casco trap. Traps have been found to be an effective tool to reduce floatables, trash, oils and sediment from becoming transported beyond the catch basin. Beyond the trap stormwater will enter into an 18" diameter perforated distribution pipe to allow for percolation of the stormwater in the surrounding  $\frac{3}{4}$ " stone and permeable soil.

The treatment of the impervious surface is as follows:

<b>Table 1 - Impervious Treatment Area Table</b>					
	Existing Impervious Area (SF)	Proposed Total Impervious Area (SF)	Net change in Impervious Area (SF)	Proposed Impervious Area with Treatment (SF)	% Overall New Imp. Area Treated
Infiltration Trench	90	2,338	2,248	2338	104%

As shown above the project anticipates meeting and exceeding the required treatment for new impervious surfaces through the use of the infiltration trench BMP.

In accordance with the Volume III: BMPs Technical Design Manual, a water quality volume of 1.0 inches times the tributary impervious area plus 0.4 inches times the tributary disturbed area is required to be treated by the Infiltration Trench. The water quality volume is calculated by the following formula:

$$\left( \frac{\text{Imp. SF} \times 1.0''}{12''/1'} \right) + \left( \frac{\text{Dist. SF} \times 0.4''}{12''/1'} \right) = \text{Treatment Volume (CF)}$$

The proposed water quality volume is as follows:

<b>Table 3 - Water Quality Volume Table</b>				
	Disturbed Area (SF)	Impervious Area (SF)	Treatment Volume Required (CF)	Treatment Volume Provided (CF)
Rain Garden	0	2,248	186	261

As shown, the size of the combined water quality volume will meet and exceed the treatment volume requirements. Values from the HydroCAD calculations are attached to this report.

### **FLOODING STANDARD – WATER QUANTITY**

The proposed project was modeled using HydroCAD to verify that the post-development conditions do not exceed the pre-development conditions. A 24-hour SCS Type III storm distribution for the 2, 10, and 25 year storm events were used. The corresponding rainfall amounts for these storms are 3.10”, 4.60”, and 5.80” respectively. Rainfall amounts are from the Northeast Regional Climate Center website (<http://precip.eas.cornell.edu>), Extreme Precipitation Tables.

Due to the numerous variables, and inherent inaccuracies with the modeling program used to calculate stormwater runoff it is custom at Acorn Engineering, Inc. to round to the nearest whole number or to the nearest tenth for urban infill project. However due to the of infiltration the stormwater runoff has been rounded to the nearest hundredth of a cubic feet per second (cfs).

### *Time of Concentration ( $T_c$ )*

A time of concentration ( $T_c$ ) of 5 minutes was applied to the subcatchment for both the pre and post-development condition, given the urban setting.

### *Curve Number*

Conservative curve number (CN) runoff values were used within the subcatchment for the landscaped area. The stormwater calculations used the following CN values in the post development condition for vegetated areas, as follows:

- 75% Grass Cover, Good

### *Pre-development Calculations*

The pre-development condition was modeled as one subcatchment to determine the net impact of the development.

- Subcatchment 1 – The subcatchment area is defined by the property line to the edge of O’Brion Street

A Pre-Development Watershed Map developed for this project can be viewed in Attachment A, and a copy of the HydroCAD calculations is included within Attachment C, or this report. Peak flow rates for the storm events are as follows:

<b>Table 4 – Pre-Development Peak Stormwater Flows</b>			
<b>Drainage Area</b>	<b>2 – Year Storm Event (cfs)</b>	<b>10 – Year Storm Event (cfs)</b>	<b>25 – Year Storm Event (cfs)</b>
<b>POI #1</b>	0.00	0.00	0.02

### *Post-development Calculations:*

The one predevelopment subcatchment was broken into two separate subcatchments for the post-development condition.

- Subcatchment 1 – This is comprised of the building’s roof and the driveway.
- Subcatchment 2 – This is comprised of the landscaped area and sidewalk.

The post development calculations include changes to the land use, and the compensation provided by the detention facility. The following table represents comparison of predevelopment and post-development condition peak runoff rates for the proposed development and tributary area.

<b>Table 5 – Comparison of Peak Flows</b>						
<b>Drainage Area</b>	<b>2 – Year Storm Event (cfs)</b>		<b>10 – Year Storm Event (cfs)</b>		<b>25 – Year Storm Event (cfs)</b>	
	<b>Pre</b>	<b>Post</b>	<b>Pre</b>	<b>Post</b>	<b>Pre</b>	<b>Post</b>
<b>POI #1</b>	0.00	0.00	0.00	0.00	0.02	0.01

As shown in Table 5 the net impact of the post development peak flows shall remain at or below the predevelopment levels. A Post-development Watershed Map developed for this project can be viewed in Attachment B, and a copy of the HydroCAD calculations is included within Attachment C of this report.

The pretreatment catch basin includes a maintenance outlet that is to be used in the event the infiltration trench needs to be dewatered for removal of fines from the 18" perforated pipe. Following maintenance the watertight cap shall be replaced.

## **SOILS**

Onsite soil information includes the following:

- Soil Conservation Service Medium Intensity Soil Survey for Cumberland County

Typical of the East End of Portland the Soil Survey list Hinckley as the existing onsite soil. The Hinckley series consists of very deep, excessively drained soils formed in glaciofluvial materials. The permeability of Hinckley soil is rapid in the surface layer and subsoil and very rapid in the substratum with typically a low groundwater table. Given the soils information, listed above, no onsite wastewater is proposed, the applicant does not intend to perform a more intense hydric soil boundary delineation or permeability test because the waiver requirements set forth in the City of Portland Technical Manual – Section 7 – Soil Survey, Rev. 6/17/12 are met. Acorn has used the conservative exfiltration rate of 2.41 in/hr when modeling the infiltration trench in HydroCAD.

The area within and surrounding the project includes soils types listed in the table below. The susceptibility of soils to erosion is indicated on a relative "K" scale of values over a range of 0.02 to 0.69. Higher "K" values indicate more erodible soils.

<b>Table 3 - "K" Value</b>		
<b>Soils Type</b>	<b>Subsurface</b>	<b>Substratum</b>
Hinckley	.17	.17

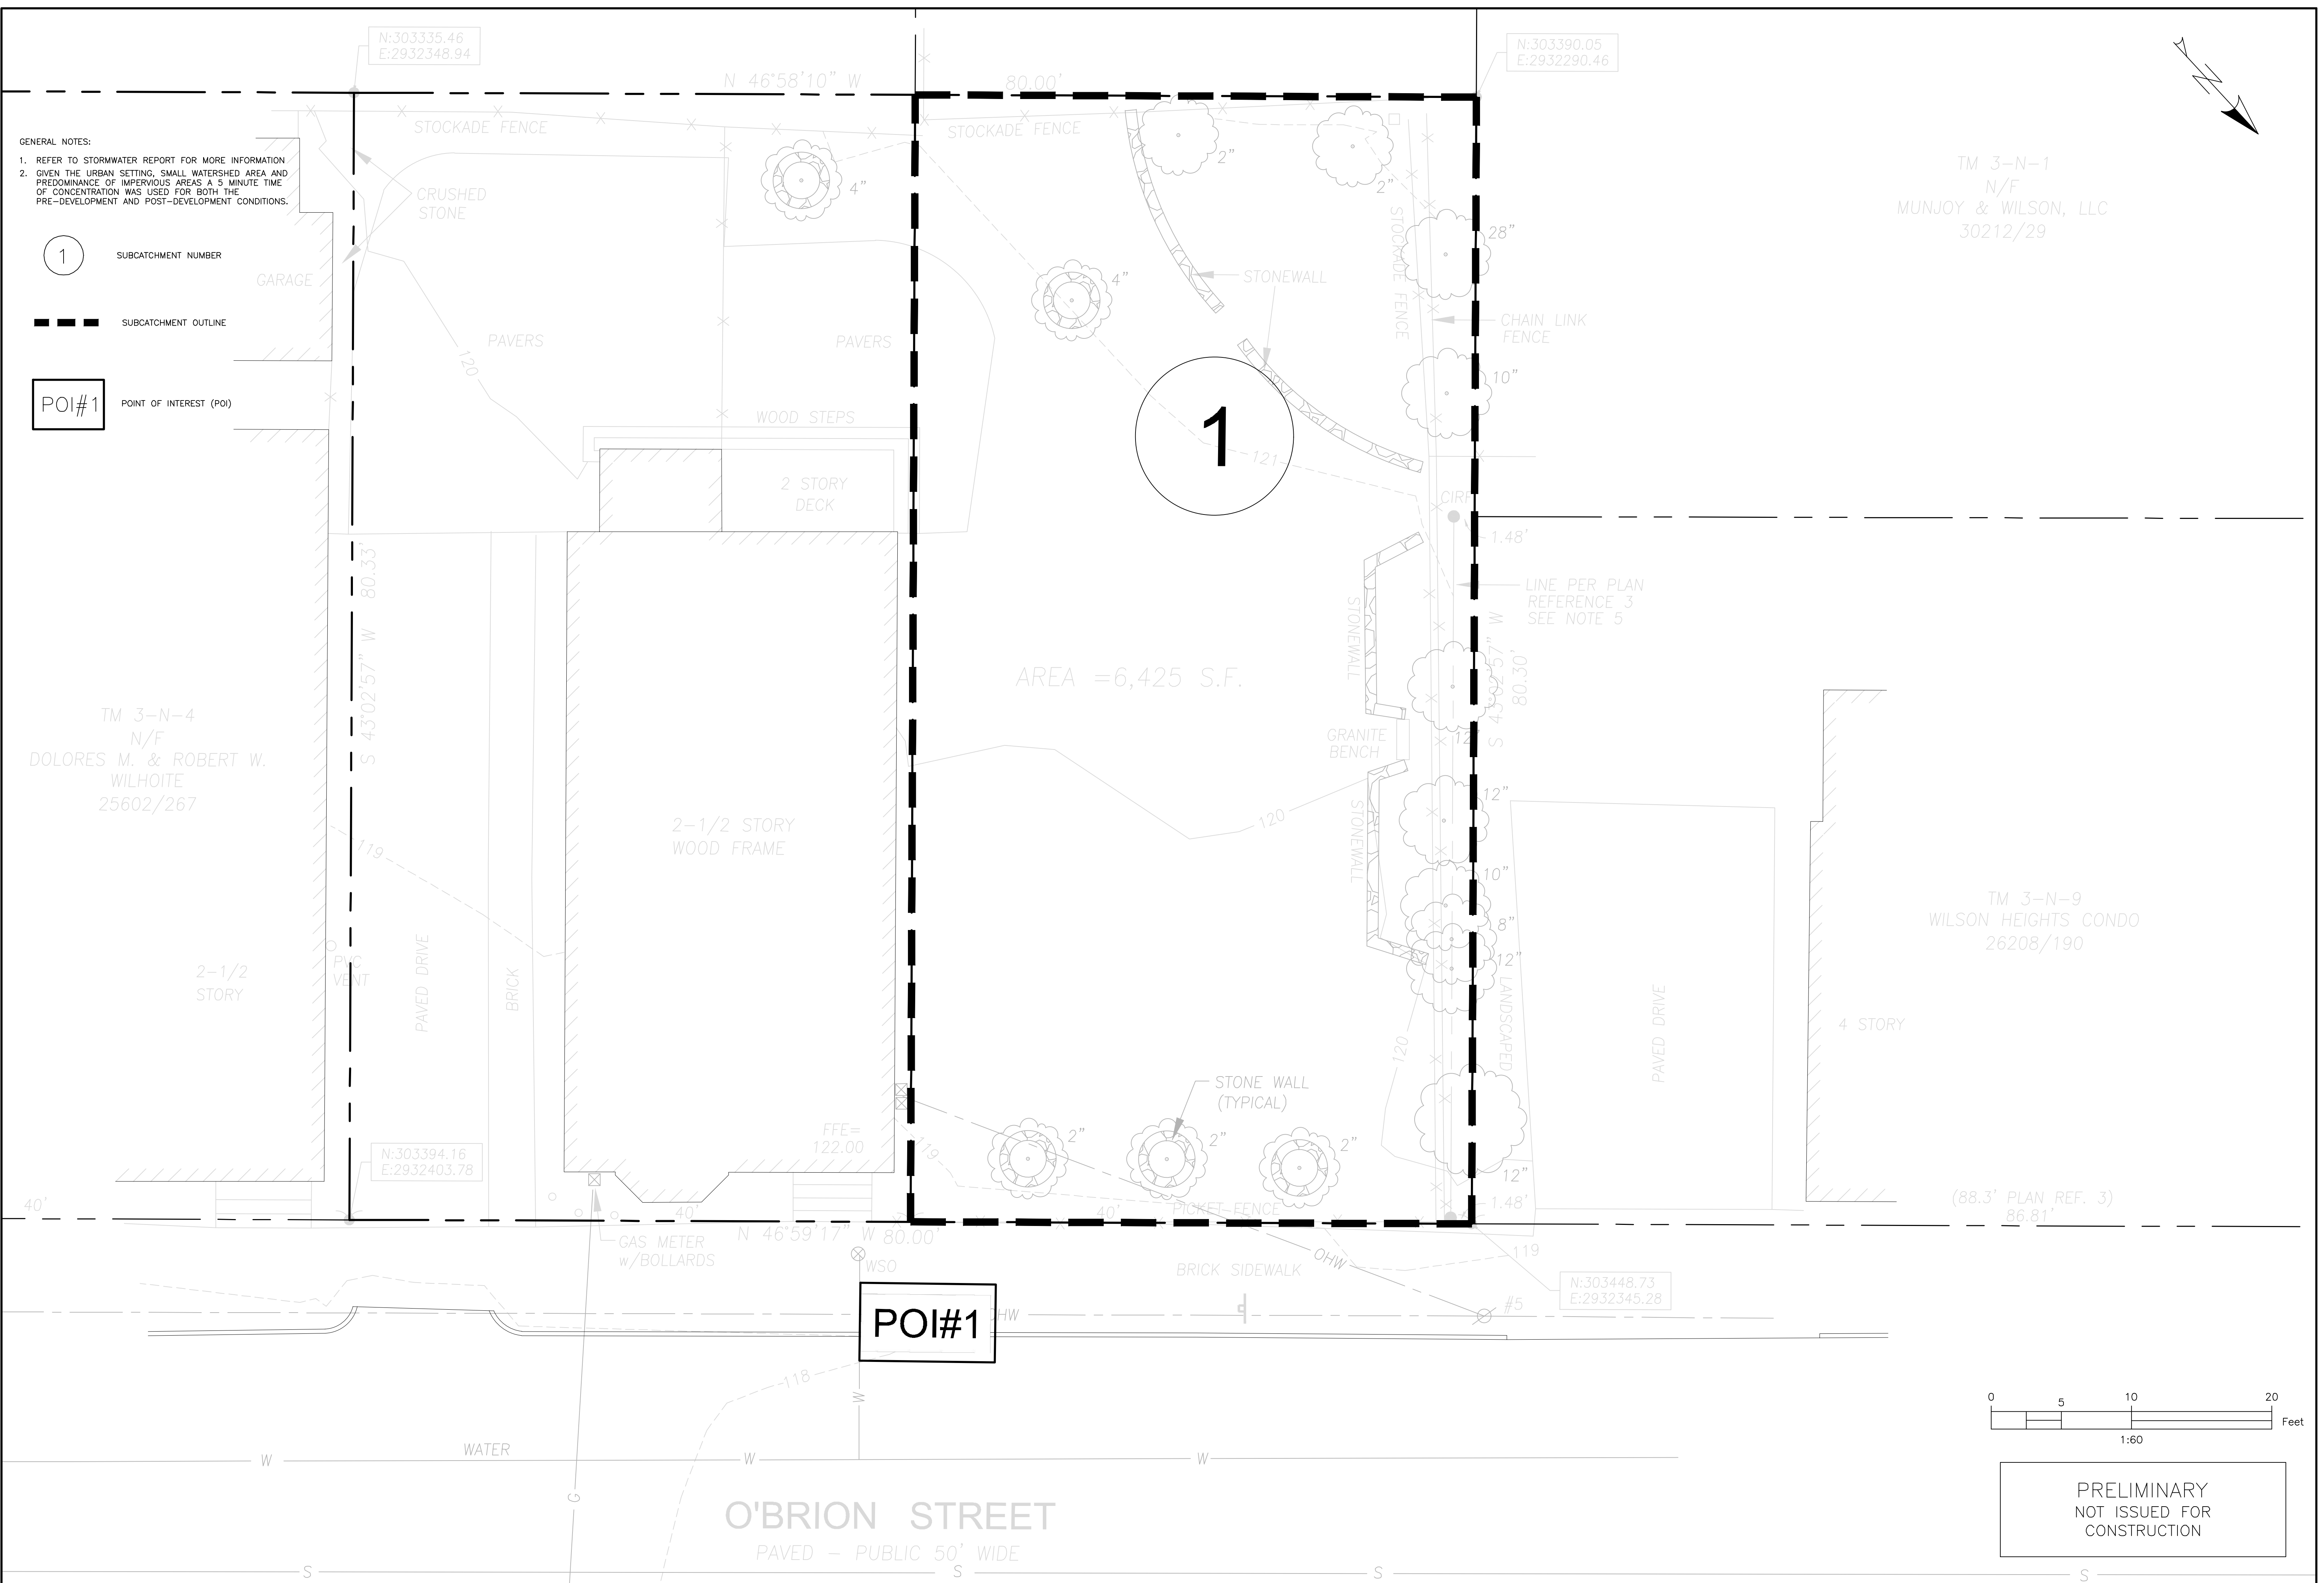

The soil "K" values for the soils, listed above, show a low susceptibility to erosion. The site's susceptibility to erosion is from the Soil Conservation Service Medium Intensity Soil Survey for Cumberland County. Although soil "K" values for the soils show a low susceptibility to erosion, implementation of the proposed Erosion & Sedimentation Measures by the contractor will be of the utmost importance, given the long sustained slopes.

## **Conclusion**

The proposed development was designed to meet the requirements implemented by the MDEP under the Stormwater Management Statute (38 M.R.S.A. § 420-D) as well as the City of Portland Technical Manual – Section 5 – Portland Stormwater Management Standards. As a result the design of the proposed development and stormwater system does not anticipate to create erosion, drainage or runoff problems either in the development or with respect to adjoining properties.
