## W-DIS-D Wireless Display Driver

W-DIS-D is a Wireless Display Driver that is required to announce any wireless-specific events from the system. It receives the event information from the wireless network and then connects to a dedicated ANN-80-W for announcement. All standard fire alarm events will report on the MS-9200UDLS and MS-9600(UD)LS just like a standard wired device. Any wireless-specific events (such as low battery), will announce a general trouble at the FACP and specific information on the ANN-80-W.
