FOUNDATION DESIGN:

Refer to soils report no. 13,163, By Summit Geotechnical, dated 11/2013.

Seismic Response Coefficient Cs

Response Modification Coefficient R

Soils engineer shall verify soil conditions and types during excavation and prior to concrete placement.

--Footings--

Design of footings is based on Maximum allowable bearing pressure 3,000 psf

Bear on crushed stone blanket on the natural undisturbed soil, bedrock, or compacted structural fill, below frost depth.

-- Retaining Structures---Earth Equivalent Fluid Lateral Pressure:

Restrained Walls (at rest) Passive Resisting 275 pcf Coefficient of Friction 0.55

Analysis Procedure

REINFORCED CONCRETE:

Design is based on "Building Code Requirements for Reinforced Concrete" (ACI 318-05). Concrete work shall conform to "Standard Specifications for Structural Concrete" (ACI 301).

Equivalent Lateral Force

Structural concrete shall have the following properties: Intended Use Max | Maximum | Slump Entrained Air Admixtures, Cement W/C Aggregate inches Percent Type Comments Ratio $\pm 1.5\%$ 'Stone Walls / Piers 5% ' Stone exterior slab on grade 4,000 6% " Stone Fibermesh interior slabs on grade " Stone Fibermesh etailing, fabrication, and placement of reinforcing steel shall be in accordance with the Manual of Standard Practice for Detailing

Reinforced Concrete Structures (ACI 315).

Welded wire fabric shall conform to ASTM A185. Reinforcing bars shall conform to ASTM A615.

Grade 60, except ties or bars shown to be field-bent, which shall be Grade 40.

Epoxy coated reinforcing bars shall conform to ASTM 775 Zinc coated (galvanized) reinforcing bars shall conform to ASTM 767.

Bars to be welded shall conform to ASTM 706.

At splices, lap bars 54 diameters unless noted otherwise.

a. Cast against and permanently exposed to earth

At corners and intersections, make horizontal bars continuous or provide matching corner bars. Around openings in walls and slabs, provide 2-#5, extending 2'-0 beyond edge of opening.

In continuous members, splice top bars at mid-span and splice bottom bars over supports.

Provide intermittent shear keys at all construction joints and elsewhere as shown on the drawings. Except as noted on the drawings, concrete protection for reinforcement in cast-in-place concrete shall be as follows:

b. Exposed to earth or weather: #6 through #18 bars #5 bar, W31 or D31 wire, and smaller c. Not exposed to weather or in contact with ground: Slabs, walls, joists: #11 bar and smaller Beams, columns: Primary reinforcement

Stirrups, ties, spirals Fibremesh admixture shall be 100% virgin polypropylene, fibrillated fibers as manufactured by Fibremesh Co. per ASTM C-1116 type 111 4.1.3 and ASTM C-1116 performance level one, 1.5 lbs per cubic yard of concrete.

Anchor bolts and rods for beam and column-bearing plates shall be placed with setting templates. All concrete work is subject to inspection by a qualified Special Inspector employed by the owner in accordance with IBC Section

STRUCTURAL STEEL:

Structural steel shall be detailed, fabricated, and erected in accordance with the latest version of AISC Specifications and Code of Standard Practice. Structural steel wide flange beams shall conform to ASTM A992.

Except as noted, framed beam connections shall be bearing-type with 3/4" diameter, snug tight, A325-N bolts, detailed in conformance with Part 4, Tables II and III, for 0.6 times the allowable uniform loads tabulated in Part 2 of the AISC Manual, 13th Edition. Install bolts in accordance with AISC "Specification for Structural Joints Using ASTM A325 or A490 Bolts".

All beams shall have full depth ¼" web stiffeners each side of webs above and below columns, Unless Noted Otherwise Anchor rods shall conform to ASTM F1554, Grade 36 (or high strength Gr 55 or Gr 105 as noted), with weldability supplement S1. Welding shall be done by a certified welder in accordance with AISC and AWS specifications and recommendations using E70-

electrodes. Where not specifically noted, minimum weld shall be 3/16" fillet by length of contact edges. All post-installed anchors shall have current ICC Evaluation Report, and shall be installed in accordance with the manufacturer's

Expansion anchors shall be approved "wedge" type unless specifically noted to be "sleeve" type. Chemical anchors shall be approved epoxy or similar adhesive type and shall have current ICC Evaluation Report. Where base

material is not solid, approved screen tubes shall be used. Grout beneath column base and beam-bearing plates shall be

minimum 28-day compressive strength of 7,500 psi, approved pre-bagged, non-metallic, non-gaseous, bleed free, non-shrink, when tested in accordance with ASTM C1107

Grade B or C at a flow cone fluid consistency of 20 to 30 seconds

CORNER BAR

TYPICAL CONCRETE WALL INTERSECTIONS

All site soils related work and footing excavations prior to placing forms, as well as site drainage, shall be reviewed by the project geotechnical engineer.

Normal reviews by Local Building Department.

Special inspection firm shall be: <u>To Be Determined</u>

Notify 48 hours prior to required review.

for correction.

Required Special Inspections per I.B.C. Section 1704 by an approved special inspector retained by owner: • Concrete: Observation of reinforcing, embeds, and forms prior to placement of concrete and observation during placement of

concrete as well as taking and testing of specimens. Refer to Section 1704.4 of the I.B.C. • Grading, Excavation and Placement of Fills: Observation during grading, earthwork excavations and placement of fills, as well

as testing for required compaction of fills. • Wood Shear Walls: Periodic Inspection of the designated wood shear framing, sheathing and holdown installation.

The Special Inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for

Duties and responsibilities of the special inspector shall be to observe and/or test the work assigned and outlined above for

conformance with the approved construction documents. All discrepancies shall be brought to the immediate attention of the contractor

The special inspector shall furnish regular reports to the building official, the engineer and architect of record, and other designated

furnished within one week of inspection dates. The reports shall note uncorrected deficiencies, correction of previously reported

The special inspector shall submit a final signed report within 10 days of the final special inspection stating whether the work requiring

special inspection was, to the best of the inspector's knowledge and belief, in conformance with the approved construction documents

and the applicable work manship provisions of the International Building Code. Work not in compliance shall be noted in the report.

deficiencies, and changes to the approved construction documents authorized by engineer of record.

persons. Progress reports for continuous inspection shall be furnished weekly. Individual reports of periodic inspections shall be

Nail wall sheathing with 10d commons at 6" o.c. at panel edges, and 12" o.c. at intermediate framing except as noted. SHEATH ALL EXTERIOR WALLS. SHEATH INTERIOR WALLS AS SHOWN ON THE DRAWINGS. BLOCK AND NAIL inspection of the particular type of construction or operation requiring special inspection.

Sheathing shall be continuous from bottom plate to top plate. Cut in "L" and "T" shapes around openings. Lap sheathing over rim joists min. 4" at all floors to tie upper and lower stud walls together. Minimum height of sheathing panels shall be 16" to a ssure that plates are tied to studs.

Except as noted otherwise, minimum nailing shall be provided as specified in IBC Table 2304.9.1 "Fastening Schedule" "Nailing

Plywood and oriented strand board (OSB) floor and roof sheathing shall be APA graded with panel identification index, thickness, and

Minimum 3-8d per stud and nail plates with "edge nail" spacing.

Sole plate at all perimeter walls and at designated shear walls shall be nailed as for braced panels with 3-16d x 3 1/2" long box nails (coated or deformed shank) per 16". 12d nails are not acceptable. Provide solid blocking between joists under jamb studs of openings.

Pre-engineered, prefabricated trusses shall be designed for the fabricator by a Professional Engineer Registered in the State of construction, and shall comply with Code Requirements. Truss to truss connections specified shall be by truss supplier, unless specifically noted on the drawings. Lower chord of gable end trusses shall be anchored to wall plate with framing anchors at 4'-0 spacing and laterally braced to roof

framing at 8'-0 spacing. Truss supplier shall specify all floor and roof truss bracing and bridging.

All roof rafters, joists, trusses, beams shall be anchored to supports with metal framing anchors. Light gage framing anchors shown or required, shall be Simpson "Strong Tie" or equal Code approved connectors and installed with the number and type of nails recommended by the manufacturer to develop the rated capacity. Note that heavy-duty hangers and skewed hangers may not be stocked locally and require special order from the factory.

All beams and trusses shall be braced against rotation at points of bearing. Unless otherwise indicated, install two lengths of solid blocking x joist depth x 12 inches long in floor framing under column loads. Columns must have a continuous load path to foundation.

Lead holes for lag screws shall be drilled in accordance with Table 6.23 of the AITC Timber Construction Manual, 3rd edition.

PLANT FABRICATED / PRE-ENGINEERED WOOD FRAMING:

STRUCTURAL WOOD FRAMING:

Studs shall be SPF No. 2 and better.

In-Grade Base Values have been used for design.

Solid timber beams and posts shall be SPF No. 1

Top and bottom plates shall be SPF No. 2 and better

2x framing shall be Spruce-Pine-Fir S4S No. 2 and better unless noted.

Wood in contact with concrete shall be pressure-treated SPF or Southern Yellow Pine.

All lumber shall be 19% maximum moisture content, unless noted.

Conventional light framing shall comply with IBC Section 2308.

nailing as noted on the drawings and in the specs.

Install panels with moisture barrier facing out.

Trussed floor joists and roof joists shall be designed and stamped by a registered engineer to support the full dead loads and the superimposed design loads noted on the drawings.

Stresses shall not exceed those listed in the NDS. 15% stress increase may not be used. Web arrangement and member forces shall be determined by the fabricator.

Manufacture and installation of trusses shall comply with

ANSI/TPI 1 "National Design Standard for Metal-Plate-Connected Wood Truss Construction",

TPI HIB "Commentary and Recommendations for Handling Installing and Bracing Metal Plate Connected Wood Trusses", TPI DSB "Recommended Design Specification for Temporary Bracing of Metal Plate Connected Wood Trusses". Calculations and shop drawings, including member sizes, lumber species and grades, and substantiating data for connector capacities, shall be submitted to the Architect and Engineer for review prior to fabrication.

Manufactured "I"-series roof and floor joists shall be buy TJI/ILevel, LPI, BCI, NJI, OJ or equal with structural wood flanges and webs, and carry Code approval for the composite section.

Bridging and blocking shall be installed according to the fabricator's requirements. Shop drawings shall be submitted to the Architect for review prior to fabrication. Beams noted as LVL on plan shall be 1-3/4" wide Laminated Veneer Lumber beams of the depth noted on plan

Shall be plant-fabricated and manufactured by I Level or equal, Shall have the following minimum allowable design stresses: Fb = 2600 psi Fv = 285 psi Fc (||) = 2460 psi Fc(\perp) = 750 psi

 $E = 1800 \, \mathrm{ksi}$ Beams noted as PSL on plan shall be plant-fabricated Manufactured by I Level or equal, and have the following minimum allowable design stresses: E = 2000 ksi

Fb = 2900 psi Fv = 290 psi Fc (||) = 2900 psi Fc(\perp) = 750 psi

SHOP DRAWINGS:

Construction Documents are copyrighted and shall not be copied for use as erection plans or shop details.

Use of SI Inc.'s electronic files as base for shop drawings requires prior approval by SI Inc, signed release of liability by subcontractor,

payment of an administration fee of \$100 per drawing sheet to SI Inc, and deletion of SI Inc's name and Logo from all sheets so used.

The General Contractor and his subcontractors shall submit in writing any requests to modify the plans or specifications. All shop and erection drawings shall be checked and stamped by the General Contractor prior to submission for Engineer's review.

Unchecked submittals will be returned without review. Furnish one (1) reproducible and two (2) prints of shop and erection drawings to the Structural Engineer for review prior to fabrication fo

reinforcing steel, structural steel, Pre-engineered Trusses

inspection of them.

Submit in a timely manner to permit ten (10) working days for review.

Shop drawings submitted for review do not constitute "in writing" unless specific suggested changes are clearly marked.

In any event, such changes by means of the shop drawing submittal process become the responsibility of the one initiating such change.

FIELD VERIFICATION OF EXISTING CONDITIONS:

Contractor shall thoroughly inspect and survey existing structure to verify conditions that affect the work shown on the drawings. Contractor shall report any variations or discrepancies to the Architect before proceeding.

STRUCTURAL ERECTION AND BRACING REQUIREMENTS:

The structural drawings illustrate the completed structure with elements in their final positions, properly supported and braced. These construction documents contain typical and representative details to assist the contractor. Details shown apply at all similar conditions unless otherwise indicated. Although due diligence has been applied to make the drawings as complete as possible, not every detail is illustrated, nor is every

exceptional condition addressed. All proprietary connections shall be installed in accordance with the manufacturers' recommendations. All work shall be accomplished in a workmanlike manner and in accordance with the applicable code and local ordinances. The general contractor is responsible for coordination of all work, including layout and dimension verification, materials coordination

shop drawing review, and the work of subcontractors. Any discrepancies or omissions discovered in the course of the work shall be immediately reported to the architect for resolution.

Continuation of work without notification of discrepancies relieves the architect and engineer from all consequences. Unless otherwise specifically indicated, the drawings do not describe methods of construction. The contractor, in the proper sequence, shall perform or supervise all work necessary to achieve the final completed structure, and to

protect the structure, workmen, and others during construction. Such work shall include, but not be limited to, bracing, shoring for construction equipment, shoring for exeavation, formwork, scaffolding, safety devices and programs of all kinds, support and bracing for cranes and other erection equipment.

Do not backfill against basement or retaining walls until supporting slabs and floor framing are in place and securely anchored, unless adequate bracing is provided. Temporary bracing shall remain in place until all floors, walls, roofs and any other supporting elements are in place.

The architect and engineer bear no responsibility for the above items, and observation visits to the site do not in any way include
