## Installation and Service Instructions

Low Emissions and High Efficiency Oil Boiler

### Logano G125 BE US/CA

For trained and certified installers

Read carefully prior to installation, maintenance and service.

Buderus

### 6 Placing the Boiler

This chapter discusses how to place the boiler in the boiler room.

#### SYSTEM DAMAGE

due to freezing temperatures

· Place the boiler in a frost free room.

#### 6.1 Clearances

Position the boiler while observing the clearances in (→ Fig. 7). Access to the boiler is reduced when reducing these clearances.

The boiler foundation must be level and sufficiently strong.

The burner door is factory installed right swinging. Youcan reverse the door swing in the field.

|   | Distan                                | CE      |  |  |
|---|---------------------------------------|---------|--|--|
| Α | Recommended                           | 51 1/8" |  |  |
|   | minimum                               | 39 3/8" |  |  |
| В | Recommended                           | 27 1/2" |  |  |
|   | minimum                               | 15 3/4" |  |  |
| С | Recommended                           | 15 3/4" |  |  |
|   | minimum                               | 3 7/8"  |  |  |
| L | see Chapter 3 "Technical Information" |         |  |  |

Table 10 Recommended and minimum clearances (Measurement in Inches)

#### NOTICE

Smaller clearances must abide with state and local code. The boiler is approved for 6" side clearances. A minimum distance of 18" to combustible materials must be maintained per NFPA 31.

Floor material must comply with NFPA 31.

#### NOTICE

Observe required distances to other components such as water piping, venting and other components.

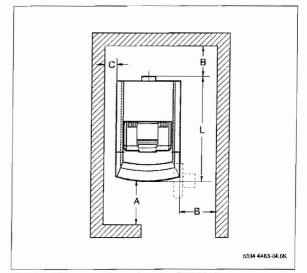

Fig. 7 Clearance dimensions for G125 boilers

#### 7.1.2 Horizontal Venting

| Venting system:<br>Comment |          |             | Max. Vent length |
|----------------------------|----------|-------------|------------------|
| Sealed vent                | Positive | Outside air | 20 ft.           |

The maximum length of the direct vent system is 20 ft. of linear pipe including 3 x 90° elbows. With 4 elbows the maximum pipe length is 10 ft.

The following two direct vent terminations are approved with the G125 BE, and are available for purchase from your Buderus supplier.

Both exhaust terminations are approved for use with two different exhaust vent pipe options.

#### Option 1:

Flexible, insulated 4" stainless steel oil vent. The insulated oil vent is rated for 1" clearance to combustibles. Wrap the adapters with 3" of ceramic wool covered with foil tape or sheet metal to maintain 1" clearance. For installation instructions -> Chapter "7.1.2.6 Installation of Insulated Flexible Oil Vent", page 26.

#### - Option 2:

Standard, 26 gauge galvanized 4" vent pipe. Maintain 18" clearance to combustibles with galvanized vent pipe (→ Chapter "7.1.2.7 Installation of Galvanized Vent Pipe", page 27).

#### NOTICE

Horizontal vent systems operate under positive pressure, which requires all seams to be sealed. Use high temperature silicone (500°F rated, G.E. 106 or equivalent) to seal any joints, screw penetrations, or combustion test holes, and seal at each pipe connection and all joints on adjustable elbows. Refer to 7.1.2.2 for details.

#### NOTICE

Installations in Canada less than 7 ft. above ground are required to have a cage/screen over the termination to prevent injury from touching hot surfaces.

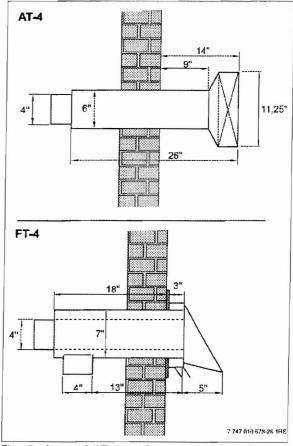

Fig. 15 Aerocowl (AT-4) and Concentric (FT-4) termination

#### 7.1.2.1 Location of Exhaust Wall Termination

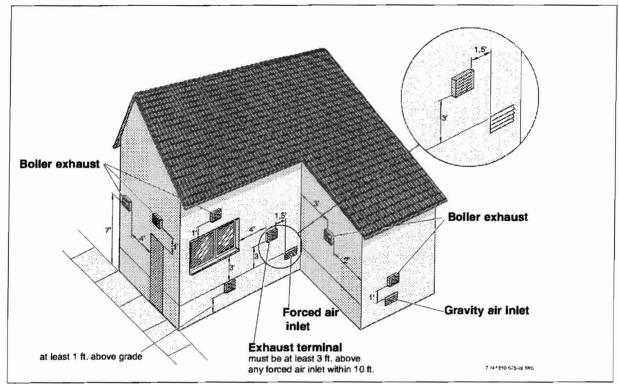

Fig. 16 Minimum clearance for termination

The location of the wall termination is one of the most important aspects of a direct-vent installation. In addition to the minimum clearances of terminations shown in Fig. 16, observe the following rules:

- Both the intake and exhaust terminations must be located on the same outside wall in order to balance wind pressure effects.
- Wall terminations shall not be facing the direction of prevailing winds.
- The exhaust terminal must be located such that flue gases will be freely dispersed without reentering the building.
- Exhaust terminal shall be at least 2 ft. from adjacent buildings, and flue gases shall not be able to enter adjacent buildings.
- The exhaust terminal shall be at least 7 ft. above grade when above public walkways. Ensure that treezing condensate does not lead to hazardous conditions on walkways.
- The exhaust terminal shall never be located underneath porches or crawl spaces, alcoves, or other building features that prevent dispersing flue gases.
- The exhaust terminal shall never be located less than 3 ft. from inside bullding corners, and never

less than 2 ft. from outside corners.

- The exhaust terminal shall be located at least 3 ft. above any forced air inlet within 10 ft. horizontally.
- The exhaust terminal shall never be less than 4 ft. below, 1 ft. above, or 4 ft. horizontally from any door, window, or gravity air inlet into the building.
- The exhaust terminal shall be at least 1 ft. above grade and snow line, and where it is not susceptible to blockage from debris, leaves or falling snow or ice.
- A ½" wire-mesh screen at the exhaust terminal must be maintained in good working order.
- The exhaust terminal shall terminate at least 3 ft. from any other building opening, oil tank vent or oil tank fill inlet, and 6 ft. from any gas service regulator vent outlet.
- 13. Select the point of wall penetration maintaining a minimum slope of ¼" per foot toward the termination on the last horizontal pipe section. The wall termination assembly must also slope ¼" per foot toward the outside to drain possible condensate from the venting system.

#### 7.1.2.2 Installation of Aerocowi exhaust termination (Part No. AT-4)

- Follow guidelines in section 7.1.2.1 regarding the relative position of the exhaust and terminal.
- · Follow manufacturer's installation guidelines of the AT-4.

This system consists of a 4" air intake hood, a 5" x 4" reducer and a 261/2" long, insulated Aerocowl exhaust termination. This termination has a zero clearance rating to combustibles. Do not install the vacuum relief damper ("not needed").

- Cut a 6" round opening in the outside wall at the selected location. Apply silicone caulking to the backside of the outer face plate and secure it to the outside wall.
- Insert the Aerocowl termination from the outside up to the outer wall stop. Ensure slope of 1/4" per foot to outside.
- Slide inner plate on the termination up to the inside wall, tighten the gear clamp and secure the inner plate to the wall.
- For Aerocowl AT-4 installations in Canada less than 7 ft. above ground, install a cage/screen over the termination to prevent injury from touching hot surfaces.

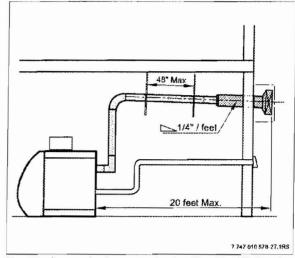

Fig. 17 Aerocowl exhaust termination (Part No. AT-4) and separate air intake hood

#### 7.1.2.3 Installation of the concentric Fields termination (FT-4)

 Follow manufacturer's installation guidelines of the FT-4

This system consists of a 5" x 4" reducer and a zero clearance concentric combination intake/exhaust termination with a 4" provision for fresh air intake piping. Do not install the vacuum relief damper ("not needed").

- Cut a round 7" diameter opening in the outside wall at the selected location.
- Remove the 4" air intake collar from the termination assembly.
- Apply silicone caulking to the back side of the wall face plate. Insert the concentric termination from the
- Ensure slope of 1/4" per foot to outside. Secure the face plate to the outside wall.
- Reinstall the 4" collar.

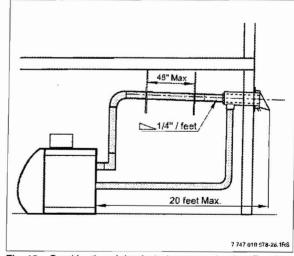

Fig. 18 Combination air intake/exhaust termination (Part No.
