Project Narrative

RE: ATM Enclosure
100 Commercial Street
Portland, Maine

On behalf of East Brown Cow, we are submitting a new application to your committee for review. This submission includes drawings, images and product information to illustrate the nature, design and extent of the project.

The project involves the addition of an ATM enclosure to the outer lobby of 100 Commercial Street. It is located on the right entrance side and extends minimally outward from the face of the façade wall with just enough presence to discourage loitering, a very real issue in this particular area.

The simple, uncluttered linear design of the enclosure, maintains and supports the historical significance of the building. Both the glass roof and glass walls follow and mimic the contour of the existing façade wall. Stainless steel angle clips and channels of anodized aluminum with stainless steel cladding support the fully tempered, clear laminated glass throughout. The plan design answers the challenges posed by ADA requirements and a site slope that changes in minute increments.

The single-leaf entry door is of monolithic tempered glass designed to accept security hardware, electromagnetic locks and security electronics.

Based on our proposed design and stamped by a professional engineer licensed in the state of Maine, the entire system will be engineered in-house and installed by Bellwether Design Technologies.
