

W. T. Grant Company

-2-

August 18, 1948

The writer visited the site with the building inspector, Mr. Callinan of the contractor's firm, and the architect for the Enterprise Stores. They were told as to the procedure to follow to make a satisfactory job on the Grant Wall. However, the work will probably not proceed without the necessary details to be adjusted between you and the contractor for Enterprise Stores.

Very truly yours

Boston, Mass.

Dear Mr. Schein:

Subject: Portland, Maine

We do not agree with the conclusions stated in your letter of August 21st since it is our opinion that our foundations as constructed are sufficient for our building in the absence of the removal of adjacent support due to your excavating operations.

We must, therefore, insist that you take whatever measures may be necessary to protect our property and building from damage which may result from your excavating on adjoining premises. See Rule 3 of Section 307 of the Building Code of Portland, Maine 1941 Second Edition 1946.

Very truly yours,

W. T. GRANT COMPANY

HEATING, COOKING OR POWER EQUIPMENT

Portland, Maine, 5/29/48

PERMIT ISSUED
00839
MAY 29 1948

CITY of PORTLAND

To the INSPECTOR OF BUILDINGS, PORTLAND, MAINE

The undersigned hereby applies for a permit to install the following heating, cooking or power equipment in accordance with the Laws of Maine, the Building Code of the City of Portland, and the following specifications:

Location Building Use of Building Hotel No. Stories 7 New Building ☒ Existing ☐
Name and address of owner of appliance Hotel
Installer's name and address Ballant Oil Equipment Co. Telephone 7-7221

General Description of Work

To install Ballant Oil Equipment Co. Burner

IF HEATER, OR POWER BOILER

Location of appliance or source of heat _____ Type of floor beneath appliance _____
If wood, how protected? _____ Kind of fuel _____
Minimum distance to wood or combustible material, from top of appliance or casing top of furnace _____
From top of smoke pipe _____ From front of appliance _____ From sides or back of appliance _____
Size of chimney flue _____ Other connections to same flue _____
If gas fired, how vented? _____ Rated maximum demand per hour _____

IF OIL BURNER

Name and type of burner Ballant Oil Burner Labelled by underwriter's laboratories? yes
Will operator be always in attendance? yes Does oil supply line feed from top or bottom of tank? Top
Type of floor beneath burner concrete
Location of oil storage Basement Number and capacity of tanks 1-269.2 gal.
If two 275-gallon tanks, will three-way valve be provided? _____
Will all tanks be more than five feet from any flame? yes How many tanks fire proofed? 1
Total capacity of any existing storage tanks for furnace burners None

IF COOKING APPLIANCE

Location of appliance _____ Kind of fuel _____ Type of floor beneath appliance _____
If wood, how protected? _____
Minimum distance to wood or combustible material from top of appliance _____
From front of appliance _____ From sides and back _____ From top of smoke pipe _____
Size of chimney flue _____ Other connections to same flue _____
Is hood to be provided? _____ If so, how vented? _____
If gas fired, how vented? _____ Rated maximum demand per hour _____

Subject: Question of location of and servicing of
fuel oil tank in the Grant Store at 510 Congress
Street, Portland

Dear Mr. Cummins:

We are still having a little difficulty about this fuel oil tank, and you will remember that we talked over the matter of whether or not this should be in an enclosed room.

The conclusion has been reached that it will not be in a separate room but will be enclosed with fire resistive enclosure as stipulated by the Building Code. I have your plan of April 1, 1943, furnished by Mr. Timmons of the Bishop Company and showing reinforcement beneath the first floor slab to bring the strength up to the required 150 pounds per square foot. For that purpose the plan seems to work out all right, but now the question has come up as to how your maintenance men will be able to clean out the tank satisfactorily. Our inspector has talked with Mr. Timmons and apparently this detail has not been thoroughly worked out yet, but he seems to think that a manhole would be provided in the upper surface of the rectangular tank, covered eventually with sand on the basis that when it was necessary to clean the tank out or service it in any other way, some access would be had to the space over the tank which is only about three feet in the clear, the sand would be removed, the manhole cover removed and the job done in that manner. This provision for servicing seems to be as difficult that I am afraid not very much servicing would be done, and we in Portland are particularly concerned about that because we are launching upon a smoke abatement program, and the experts tell us that one of the principal reasons for excessive smoke with oil burners is the accumulation of sludge in the bottom of the fuel oil tank. In fact we have one tank in town now where they do not seem to be able to get this sludge out.

There is no objection to the contractor going ahead and putting in the steel beams to reinforce the slab, but a permit is needed for construction of the fuel oil tank as well as the installation of the oil burning equipment, and before any such permit is issued or any work done upon the tank or the proposed enclosing walls, please furnish plan showing some practical way of providing clean-out arrangements and adequate access to the inside of the tank. Perhaps one way to make arrangement and still comply with Building Code requirements would be to keep down the two enclosing walls still to be built to a level 12" above the upper surface of the tank and then fill the sand only to that level. Even so, to service the tank would make very close quarters, but the arrangement would comply with Building Code requirements.

If you still hold to the idea of constructing the walls to the waterside of the first floor, all around, I think you are really providing a room for fuel oil tank, and the access door (fire door) should not only be shown but the automatic ventilation system to purge the room of gas fumes before a man enters, the purging fan to start automatically when the access door is opened and be not possible of shutting off until the access door is closed.

Our inspector has the impression that there are quite a number of pipes over the spot where the tank would be now, and, if so, of course, difficulty of providing a clean-out arrangement is materially increased.

Mr. F. A. Cunniff ----- 2

April 16, 1913

Mr. Timmons of the Bishop Company and the Fels Company, the latter having a permit to increase the size of the existing boiler, are each receiving a copy of this letter. It is not known who will install the oil burning equipment, but that party is required to get a separate permit from this department before commencing installation, and we should have full information about the fuel oil tank and all arrangements about it before that permit for the oil burning equipment can be issued. Question often arises as to who shall get the permit for installing the fuel oil tank, as often that it is done by others than the installers of the oil burner assembly. We are willing that the fuel oil tank shall be included in the installation of oil burning equipment, whether the tank is actually built by the installer of the oil burning equipment or not, as long as the one to whom the permit is issued makes the connection of the oil supply lines and the fill and vent pipes to the tanks. No doubt the tank will be welded in position, and I presume that you will see to it that the tank is designed heavy enough to take the weight of the sand on the top and any other added loads due to maintaining the tank and also against the maximum internal pressure.

Very truly yours,

Inspector of Buildings

Subject: Permit for addi-
tions to existing steam
boiler at 510 Congress St.

Gentlemen:

The permit for the above work is issued herewith to the
installer subject to the following:

1. This permit includes only the work on the boiler and
does not cover the installation of the oil burner and fuel
storage tank, which must be covered by a separate permit issuable
only to the actual installer of the oil burner. Before issuance
of any such permit we shall need information as to the enclosure
for the tank. Unless the first floor construction over the tank
is capable of supporting a live load of at least 150 pounds per
square foot, a reinforced concrete slab at least 5" thick is re-
quired over the enclosure and details of its design and construc-
tion will be needed. The 2" diameter pipe from top of tank through
first floor above for tank cleaning purposes as shown on the base-
ment mechanical plan is not allowable.

Very truly yours,

Inspector of Buildings

MSB/s

CC: Mr. P. A. Curran
W. T. Grant Company
1241 Broadway
New York 13, N. Y.

P.S. Construction engineers letter 3/29/41 says live load
strength of 1st floor is 100/ per square foot, so the reinforced
slab over tank enclosure appears necessary.

W. T. GRANT COMPANY

1441 BROADWAY · NEW YORK 18, N. Y.

8/8

July 26, 1949

Mr. Warren McDonald
Inspector of Buildings
Department of Building Inspection
Portland, Maine

Dear Mr. McDonald:

Re: 510 Congress Street
Portland, Maine

When I was in Portland some weeks ago, the existing condition in the escalator machine room did not merit an exhaust system as installed. Inasmuch as construction adjacent to our building offers difficulty in exhausting this air, and as the building superintendent has never found it necessary to operate the fan under the worst weather conditions, I asked your approval to remove said fan and duct system. You gave me verbal approval at the time and we would like a written confirmation of same.

Yours very truly,

W. T. GRANT COMPANY

1441 Broadway
New York, New York

Subject: Ventilation system of escalator
machinery room in W. T. Grant Store at
510 Congress Street

Dear Mr. Cunniss:

We have approved the installation of the ventilation system,
oil burning equipment and adjustment of the heating plant as performed
by the Fels Company by letter to that company.

In making final inspection our inspector reports that a seemingly
important change has been made in the ventilation system of the escalator
machinery room, due to the construction of a parapet wall on the Enter-
prise Store next door, higher than had been anticipated by your clerk of
the works and thus very much reducing the area of the exhaust outlet of
the escalator machinery room ventilation system.

Although not certain of the purpose of this ventilation system other
than to cool off the machinery room, I am told that the system relies for its
intake of air upon the supply from the general store entering the machinery
room through various small openings around doors and the like.

Presumably you are aware of this condition, but the situation is called
to your attention just in case you may be informed of some hazard that might
arise due to the reduction in area of outlet.

Very truly yours,

Inspector of Buildings

W. T. Grant Company
514 Congress Street

Subject: Permits for the installation of one
passenger elevator, one dumb waiter, one
escalator, one freight elevator and the ex-
tension of another freight elevator in the
store of W. T. Grant Company at 514 Congress
Street

Gentlemen:

The above permits are issued herewith to the installers subject to the following:

1. Doors to the various shaftways are required to be Class B (labeled) doors either automatic or self-closing. It is our understanding that the doors are to be used in the openings of the freight elevator and dumb waiter shafts. The attention of the owner is called to the need for care to avoid the possibility of one of these doors at the floor at which the elevator may be left at the end of the day's business being left open and thus voiding the protection against spread of fire which the enclosed shaft is intended to provide.

2. Attention is also called to the requirement of Section 703a of the Building Code that suitably screened openings equal in aggregate area to no less than 233 square inches must be provided in the reinforced concrete floors of the machinery rooms in the freight and passenger elevator shafts.

3. Information given on application for permit states that in the case of the passenger elevator the minimum clearance between buffer plates and springs when the car is at the lowest floor level is to be only 9". Section 702b6 of the Building Code specifies that this clearance shall be no less than 12" and this permit is issued on the basis that the latter clearance will be provided.

4. Although there are no detailed specifications for the installation of escalators in the Building Code, the "American Standard Safety Code for Elevators, Dumbwaiters and Escalators—Fourth Edition, 1937" has been approved by the Municipal Officers as standard procedure to be followed in the construction and installation of all such equipment. The permit for the installation of the escalator is issued of course on the basis that all provisions of the above Code relating to such details as specified for the balustrading, treads and landings, safety devices, machine room equipment etc. will be provided.

Very truly yours,

Inspector of Buildings

STATEMENT OF ELEVATOR TESTS

Otis Elevator Co.

PORTLAND, MAINE

March 17, 1949

I, Ellis S. Hanson

as an employee of Otis Elevator Company, have personally supervised the
 installation of alterations to the elevator, dumb waiter, escalator, hatchways and enclosures at W. T. Grant Co. as permitted
 under Building Permit , and have personally supervised tests of loading capacity and of all brakes, inter-
 locking and all other safety devices, and I do here state that, according to my best knowledge and belief, the elevator will
 safely carry the maximum rated loading and all brakes, interlocking and other safety devices are in satisfactory condition.

Ellis S. Hanson

Re: W. T. Grant Store

Computations involving the stability of the walls on this building are being left with your office.

These walls have been analysed as follows:

- Sheet No. 1. This shows the computations for wind on the high wall on Free Street taking the stair and elevator shaft as free-standing shafts extending with no lateral support above the second floor level. This level was taken because of its substantial concrete construction with consequent adequate lateral support. These figures indicate that the resultant of wind and dead weight of walls will fall within the middle third of the base, showing no tension occurring in the brickwork.
- Sheet No. 2. This shows the theoretical stress in a horizontal section of wall spanning the stairwell, figuring no lateral support from stair construction.
- Sheet No. 2A. This shows the computations for wind on the Free Street wall taking the stair and elevator shaft as free-standing shafts extending with no lateral support above the sidewalk grade. This again shows no tension in the brickwork and with a factor of safety against overturning of 3.
- Sheet No. 3. This shows the stress in the brickwork for full load on the Free Street wall.
- Sheet No. 4. These give the computations on the sidewalls at the Congress Street end of the building where the mezzanine floor does not occur. This is for full live and dead loads with resultant stresses due to combined vertical and wind loads.
- Sheet No. 5. & No. 6. This gives an analysis of the first story of the sidewalls on the Congress Street end showing the combined stresses due to dead loads and wind load at mid-story height. This shows the low values of 73 and 17 pounds per square inch on the outside and inside of wall respectively. Also the lateral pressure of the wind on the third floor slab is 6 pounds per square inch.
- Sheet No. 7. This gives the analysis of the second story of the sidewalls on the Congress Street end showing the combined stresses due to dead loads and wind load at mid-story height. The stress in the masonry is 32 and 14 pounds per square inch and the outside and inside respectively.

I believe from the above analysis it can be seen that all stresses in the masonry are low as compared with the code safe working stress of 170 pounds per square inch, and hence believe the construction to be adequate.

It might be well to have additional details showing the wall bracing between the third floor slabs and walls. This will be furnished in the near future.

Re: Portland, Maine Store

RECEIVED

SEP 3 1947

DEPT. OF BLD'G. INSP.
CITY OF PORTLAND

Gentlemen:

We have reviewed the letter of the Inspector of Buildings in reference to wall thicknesses and heights, particularly those on the Free Street elevation where, in some places, the walls are higher than the Portland Building Code allows.

This particular wall may be divided into two sections. One section is carried at the mezzanine floor by a large concrete beam spanning the show windows. The bearing wall in this case should be measured from the mezzanine floor level upward. If taken to the top of the roof steel (as usually specified by many codes) the height would be a few inches over thirty-five feet. This is so close to the limit that we believe there should be no objection to this portion.

The remaining section of wall, which is one story higher, is partly carried over the show window at the mezzanine floor level, the remainder being a free standing bearing wall for its full height. While this portion of wall exceeds the Portland Code limits, we consider it to be structurally adequate. As mentioned in the letter of the Inspector of Buildings, the 1944 edition of the American Standards Association permits 12" walls for a height of 70 feet. However, what makes the construction safe beyond question, in our opinion, is the fact that this high wall is braced by three cross walls which run at right angles to the front wall and form buttress supports for this wall. These cross walls are of 12" brick and are about 9'-0" long. In effect there are two stack or box sections formed

W. T. Grant Company

-2-

August 27, 1947

by the stair well and elevator shaft. The only loads on the wall, in addition to its own weight, is the load from the stairs and penthouse roof.

We feel that if this wall is analysed from this angle rather than from height alone it may readily be seen that this is a special case requiring special consideration.

The extended side walls are higher than the 35 feet limit of the Portland Code but would pass the New York City requirements of 55 feet. In addition, these walls are braced to a limited extent by pilasters.

Very truly yours

SEELYE, STEVENSON & VALUE

Subject: Amendment of Portland
Building Code with relationg
to thickness of masonry walls

Dear Mr. Cunnius:

After our telephone conversation today, I thought perhaps
the good way of making the situation clear would be to send you,
and I am enclosing herewith the actual text of the amendments to
the Building Code which were adopted by our City Council last
night—September 3, 1947.

Very truly yours,

Inspector of Buildings

WMcD/S

Encl: Amendment to Building Code of Portland, Maine
relating to thickness of masonry walls

Figure 1. A schematic diagram of the experimental setup. The subject is seated in a chair, viewing a screen displaying a target (a red dot) and a starting point (a green dot). The subject's hand is positioned at the starting point, and the target is located at a distance of 10 cm from the starting point. The subject is instructed to move their hand from the starting point to the target. The screen is positioned at a distance of 10 cm from the starting point. The subject's hand is positioned at the starting point, and the target is located at a distance of 10 cm from the starting point. The subject is instructed to move their hand from the starting point to the target. The screen is positioned at a distance of 10 cm from the starting point.
