
RAINWATER MANAGEMENT

With ProShield Leaf Protection

What is Rainwater Management?

Over time, water can be one of the most destructive elements your home will endure. An effective rainwater management system channels water away from your foundation/basement in order to help prevent damage to your most valuable asset, your home.

An effective rainwater management system minimizes:

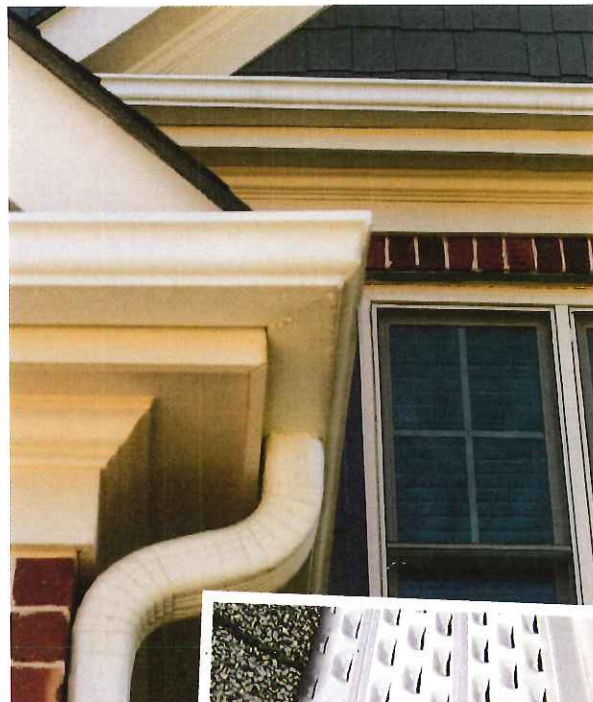

- Leaks into your home
- Mold growth
- Deck and foundation damage
- Infestation of termites and mosquitoes
- Leaf and debris buildup
- Landscape destruction due to water saturation

Why Leaf Protection?

Leaf protection is designed to achieve two goals: (1) prevent your gutters from clogging, and (2) maximize rainwater intake. No leaf protection product can completely accomplish both goals but, of the many designs on the market, perforated aluminum panels provide the best balance between the two.

ProShield™ Leaf Protection

The Home Depot®'s exclusive ProShield™ Leaf Protection technology is specifically designed to achieve a balance between water handling and debris blocking. ProShield™ was developed to handle the most water possible while guaranteeing your gutters will not clog. Periodic cleaning is required to remove dried debris from the surface.

CARE & MAINTENANCE

ProShield™ is a very efficient gutter protection system that significantly reduces the amount of debris that enters your gutter, thus eliminating the clogs that stop the water flow through your downspouts. This system may occasionally leave debris on top of your leaf protection. Periodic cleaning may be required to remove this surface debris, ensuring the system stays clear and works properly.
