

## **15. Written Summary of Significant Natural Features**

## **Summary of Significant Natural Features**

The project site is a previously developed urban site that is almost entirely consisting of impervious surface. The Fore River is adjacent to and underneath the existing wharf and project area. Due to the concrete wharf, the seawall, and the adjacent paved areas, there is no significant botanical activity in the project area.

In previous projects at the site, MaineDOT has screened the project using GIS Datalayers from the Maine Office of GIS. No rare, threatened, or special concern species were noted on the project site.
