

Load Capacity		
Maximum compressive bearing capacity[1,3] (allowable load)	Lateral bearing capacity[2,4] (allowable load)	Factored bending resistance (ultimate load)
(lbs)	(lbs)	(lbs.ft)
33,750	2,250	6,454

NOTES:

1	The maximum tensile load capacity can be obtained, conservatively, by halving the values of the bearing capacity in compression shown in the selection table.
2	The lateral capacity depends on the density of soil (to validate consult technical department of Techno Metal Post.)
3	When the pile is laterally unsupported (soil very loose / soft, liquefiable soils, water and air), the structural strength of the pile must be approved by the technical department of Techno Metal Post.
4	The values of lateral capacity are average values and can be modified, more or less, depending on the characteristics of the existing soil.
5	If required, piles may be field welded with extensions to achieve greater loading capacities in poor soil conditions.
6	If required, the helical pile and the supporting plate can be galvanized in compliance with standard ASTM A123
