

Things that make *GLAMOUR POOLS & SPA* different from our *COMPETITORS*:

- **We don't not use blocks under uprights.**
 - *These can cause your pool to move unevenly as the ground shifts below it, leaving a potential for a ripped liner or a torn wall.*
- **We use stone dust on the bottom of the pool.**
 - *Sand makes it easier to leave footprints at the bottom of your pool.*
 - *Stone dust creates a uniform structure that shifts as one unit, unlike blocks or bricks.*
- **We use foam on top of the stone dust.**
 - *This makes it easier on your feet, as well as your liner, making it harder for the liner to rip or tear.*
- **We use pool cover around the perimeter of the pool.**
 - *Pool cover creates a gradual slope for your liner, making it harder to rip or tear.*
 - *Sand can get matted down and can go under the wall of your pool and cause winter damage.*
- **We make an 18" shelf all around the outside of the pool.**
 - *This gives your pool room to drip around the perimeter without causing corrosion to the stone dust below, which can cause your pool to tilt over time.*
