

**Erosion and Sediment Control Plan
Proposed Supervalu Parking Expansion
Portland, Maine**

General

This plan has been developed to provide a strategy for dealing with soil erosion and sedimentation during and after the construction of the proposed Supervalu Parking Expansion being developed off Milliken Street within the Riverside Industrial Park in Portland. This plan is based on the Standards and Specifications for Erosion Prevention as contained in the Maine Erosion and Sediment Control Handbook for Construction: Best Management Practices (dated March 1991).

The site currently consists of a distribution center with associated impervious parking for employees and tractor trailers. The developed portion of the site is primarily flat with steeper wooded slopes along the sides of the building.

Construction Phase

In order to protect the soil, water, wetland, and wildlife resources of this development and adjacent lands, only those areas necessary to construct the parking area, utilities, and stormwater management structures will be disturbed.

Equipment anticipated to be used for construction includes backhoe(s), truck(s), loader(s), bulldozer(s), cement trucks, asphalt paver, and roller. The following actions will be taken:

1. Those areas undergoing actual construction will be left in an untreated or unvegetated condition for a maximum of 14 days from final grading of the loam. Loam will be stockpiled for future use and protected from erosion losses by mulch and filter fabric barriers. The location of such stockpiles shall be determined by the contractor at the time of construction.
2. Prior to clearing and grubbing, filter fabric fencing will be staked across the slope(s), on the contour, at or just below the limits of clearing or grubbing, and/or just above any adjacent property line or wetland to protect against construction related erosion.
3. All silt fencing will be inspected, replaced and/or repaired weekly, as well as immediately following any significant rainfall or snow melt. Sediment will be removed and returned to the site when it reaches 1/3 the fence height.

4. Any fill used on the site will meet MDOT Standard 703.18 for common borrow and MDOT Standard 703.06(b) for subbase aggregate.
5. If final seeding of the disturbed areas is not completed by September 15th of the year of the construction, then on that date these areas will be graded and smoothed, then prepared to be seeded to a winter cover crop of Rye at the rate of 112 lbs./acre or 3 lbs./1000 sq. ft. The Rye seeding will be preceded by an application of 3 tons of lime and 1,000 lbs. per acre of 10-10-10 fertilizer or its equivalent. If the Rye seeding cannot be completed by October 1st, then on that date, hay mulch will be applied at the rate of 2 tons per acre to provide winter protection. If Rye does not make adequate growth by December 1st, then on that date, hay mulch will be applied at the rates specified under Vegetation Plan #4.
6. During the construction phase, intercepted sediment will be returned to the site and regraded onto open areas. Post seeding sediment, if any, will be hauled to a disposal area approved by the City of Portland.

Vegetation Plan

Revegetation measures will commence immediately upon completion of construction except as noted under paragraph 6 above. All disturbed areas not otherwise stabilized will be graded, smoothed, and prepared for final seeding as follows:

1. Four inches of loam will be spread over disturbed areas and smoothed to a uniform surface.
2. In lieu of soil tests, agricultural limestone will be spread at the rate of three tons per acre. 10-20-20 fertilizer will follow at the rate of 800 lbs. per acre. These two soil amendments will be incorporated into the soil prior to seeding.
3. Following seed bed preparation, any sediment-stormwater detention structures, swale areas, fill areas, and back slopes will be seeded to a mixture of 35% Creeping Red Fescue, 6% Red Top, 24% Kentucky Bluegrass, 10% Perennial Ryegrass, 20% Annual Ryegrass, and 5% White Dutch Clover. The lawn areas will be seeded to a premium turf mixture of bluegrass and/or Fescue with a seeding rate of 2-3 lbs. per 1,000 square feet.

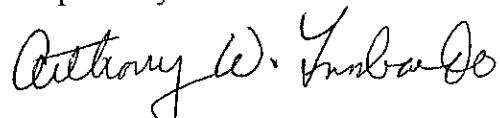

* Lawn quality sod may be substituted for seed only.

4. Hay mulch at the rate of 100 lbs. per 1,000 square feet or a hydro-application of asphalt, wood, or paper fiber will be applied following seeding. A suitable binder, such as Curasol or Terratack, will be used on hay mulch for wind control. At a minimum, the soil must be covered.
5. All filter fabric barriers will remain in place until seedings have become 75% established and then removed within 10 days.

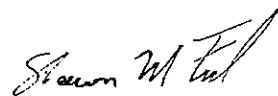

Monitoring

Maintenance measures will be applied as needed during the entire construction cycle. Weekly and after each rainfall, a visual inspection will be made of all installed erosion control measures and repairs will be made as needed to insure their continuing function as designed. Following the final seedings, the site will be inspected every fifteen days until the seedings have been established. Established means a minimum of 75% of area vegetated with vigorous growth. Reseeding will be carried out, with follow-up inspections, in the event of any failures. All erosion control measures will be removed within 10 days when vegetation is adequately established.

Re: Performance Bond #5797212, dated July 26, 1994
56 Milliken Street Dock Addition and Related Site Work

Dear Mr. Schmidt:

This is to inform you that I am authorizing the release and return of the above-named performance bond. This bond was required by the city as a performance guarantee for the dock addition and related site work at the SuperValu Distribution Center.

As there is no mailing address on the face of the bond, I am unsure of whom to notify at the Safeco Insurance Company. I am therefore returning the bond to you, so that you may forward it to your insurance company.

If you require any further information, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Kline".
