HP 65 Bishop Street-I 4/17/K

April. 5, 1950

Mr. Henjamin Lewis Lewis Lumber Company 65 Bishop Street Portland, Maine Subject: Advanced permit for excavation and construction of foundation cally for planing will at 65 Hishop Street

Dear Mr. Lewis,

After we had made every effort that we could to assist you in getting excavation and foundation for the proposed building during the mild part of the
early winter, bad weather overtook you before you got a great deal done, and it
is necessary now to got all of the matters cleared up so that when you are ready to
start again, all will be in order.

On January? we issued an amendment to the original advanced permit for excavation of feundation only to increase the width of the mill and for the constructions of only winety-dix feet of the mill. This amendment was apprecial and issued based on a plant plan only which was hurriedly marked up in erayon in an attempt to show what you then proposed—information which in ne way would satisfy the obligation upon up to have full information of what is intended before a permit is insued.

All of this was done in an effort to assist you, and based on your wan statements on the application for assendment to the effect that you would furnish a revised detailed planof foundations showing the true proposition and compliance with Building Code for the design of foundations depending upon the type of roof construction decided upon; and that in the meantime you would work closely with the architects to avoid getting in foundations which would not work out with the roof construction determined upon.

No information besides the plot plan has been received, probably, because you found that you had to stop work on the building. You did bring in plans of roof trusses by Beneroft-Martin or had them sent to me and asked me approve them, I had he well you that we do not approve plans cutside of application as for permits, that we could not even examine these truss plans intelligently, since you had fure nished as intelligently as to be framed.

Inasmuch as you have not yet made good on the detailed place of the foundations which you really intend to build, it becomes necessary to stop all work on the project under advanced permits issued as provided in Section 107 of the Building Code. The Building Code really requires that this order shall be served on you or ment by registered mail, but this is a friendly proceeding in an effort to help you get your plane all straightened out and the final permit for the building issued without further ado; so we are not following strictly the usual formalities.

Bouldes the advanced permit for partial excavation and foundation construction which we have issued and by this letter cancelled, you have here an application for a permit to build the entire building at a cost of thirty-five thousand dollars, and with the application you paid a fee of thirty-five dollars. The application calls for the construction of a mill 70'x192'. Since then (the application was filed on Oxtober 6,1049) numerous changes have been made as regards location, length and width of the proposed building, and as to type of roof construction.

Hr. Benjania lewis-spensor-spensor-

April 5, 1950

Prosumably you will soon in ready to start construction again and we want to assist you to get started when you want to and to proceed clear through to the final building without interruption. To this end I remeetfally suggest that you have the originals of your architectural plans revised and fresh completed prints filed here with your original application for general mentionetinction permit, adjust the estimated cost and the building permit fee accordingly, so that we can check the plans against the Building Gode and issue they permit at an early date to cover the such as Job which you want to do now.

The revised plans should show the correct location of the future entire project, and the correct location of the portion that you plan to construct under this peralt. They should also show full details of arrangement and designs of foundations, franking, including roof franking, and incorporating the Bancroft-Mertin design of transes, if you intend to use them, and also the negign of the 15° width of roof which would not be supported by their trusses.

May I have from you about this metter before April 17,19507

Yery truly yours.

Narran Mallonald. Inspector of Buildings

CO: Miller & Beal Indes 465 Courses Street

Mr. Benjamin Lewis 65 Bishop Street. Mr. George 1. Chase c/o Lewis Lumber Company 65 Bishop Street

Subject: Amandment of advance permit to cover excavation and foundation only of the planing will at 65 Hishop Street—the smendment to constitute a change in excavation and founda-

Gantlemen:

This attendment is approved without clear information as to how the superatructure is tobe framed and without clear details of the formeations, at the owner's request to enable the owner to take advantage of the mild weather at the present time to construct the foundation; but subject to the following canditions:

The owner is to proceed with all possible haste to make the decision as to what shape and size of roof structure is to be used, not to have the foundation plan revised immediately to show all details of the foundations now proposed and precisely that part of the finally projected structure is to be built at this time and covered by the permit.

The owner is proceeding under a seruit without definite information aust take full responsibility for any mistakes rade in location or design of foundations, making all finally to comply with Eullding Gode requirements.

I when both of you were in the office, Fr. Lowis had the idea from a mill that he owns claewhere, that it might be economy to span with roof trusses only the originally intended 70' width, and to frame the extra 15' of width now intended as a comparatively flat roof, thus keeping down the length of span of the trusses, which is desirable, and perhaps effecting some according to well.

If this scheme is followed, extra care must be exercised in designing and constructing the foundations because one susport of each truss would probably be an isolated fier and, therefore, more ettention to lateral stiffness will be necessary.

fery truly yours.

Warren McDonald Inspector of Buildings

CC: Miller & Boal, Inc. 465 Congress Street

AF 65 Bishop Street (Advance pomuit)-I

> Written - December 9, 1949 Sent with advance permit - December 22, 1949

Lewis Lumber Company 65 Bishop Street Portland, Maine

Subject: Advance permit for excavation and foundation only for new planing mill at 65 Bishop Street

Gentlemen:

Advance permit for excavation and foundation only for the above job is issued herewith, subject to the following:

All of the founda ion piors and foundation walls are to extend to a level no less than 4' below he surface of the ground. None of these depths appear to be shown in figures on the plans and one or more of the piors seems to scale less than 4' below the grade of the ground.

All of the concrete footings and the concrete walls are to have forms to shapeup the concrete according to dimensions on plans. The walls of the excavation are not remitted to serve as forms.

After the plers on the end of the platform toward the Hawboldt property have be formed up and the forms built for the other end wall of the mill and defore any concrete or anything else has been placed in the forms for the entire job; you are to notify this office for a check of location and nothing is to be put in the forms of any part of the foundation until the location has been checked and the "go-ahead" given. When notice of readiness for this check of location is given, it is important that the property line between Hawboldt property and yours and the property line between your property and that adjoining toward Horrills Corner be accurately marked by stakes or otherwise so that the location of the mill can be accurately checked.

. After the "go-ahead" has been given it will be necessary of course to cast the anchors for all of the weeden sills and posts to rest upon the foundation, into the concrete, but no work above the level of the foundations is to be attempted until the general construction permit has been issued. For more information about the general construction permit, please see separate letter.

Very truly yours,

Warren McDonald Inspector of Bulldings

P. S.No foundations are discovered beneath the outside platform and steps at new exit. Fiers are required under outer end of platform and beneath steps, no less than 8x8 at the ground level, no CC: Miller & Beal, Inc. less than 10x10 at the bottom of pier, to extend 4 below grade 465 Congress Street and 6" above.

BP 65 Bishop Street-I (Amendment 4 4)

December 20, 1950

Lewis Lumber Co., 65 Bishop Street Portland, Maine Copy to: Engineering Services, Inc. 844 Stevens Avenue

Gentlemen:

Amondment # 4 to permit 50/624 covering a 36° extension of the open plutform on the westerly end of the new mill at 65 Bishop Street is issued herewith based on the plans filed with the application but subject to the following:

- 1. It is understood that 8x8 posts are to be provided between the tops of the concrete piers and the underside of the 8x8 sills. These posts are to be all one piece in cross section and not built up of 2x9's as are the posts above supporting the trusses.
- 2. The 8x8 posts supporting the trusses are to be built up of 4-2x5°s extending in one length from sill to truss. Besides the bolt, shown on the plans at top and bottom of each post, 3/4" diameter bolts extending through the posts with 3x3x3/16" plate washers on each end are to be provided at intermediate points on spacings not exceeding 50" on centers vertically. The sides of the posts where the edges of the 2x8's are exposed are to be covered with full width boards or planks to keep the weather from penetrating the cracks between the 2x6's.

Vory truly yours,

Warren McDomild Inspector of Buildings

ANS/B

P. S. After further consideration of the matter, I feel that the posts supporting the roof of the existing platform should be bolted at intervals of not
over 30" as indicated for the new posts above and the edges of the 2"
mambers making up the posts should be covered as called for above.

inspector of Buildings

BP 65 Bishop Street-I (Amendment #4) 12/22/50/ATH

December 12, 1950

Lewis Lumber Company 65 Bichop Street Portland, Maine

Copy to: Engineering Services, Inc. 844 Stevens Avenue

Contlemen:

In checking the application for amendment #4 to permit 50/624 covering extension of open platform on the westerly end of new mill at 65 Bishop Street the following questions concerning old and new work are raised:

- 1. We find that the foundation piers for the addition have already been constructed, apparently even before the application for the amondment was filed, As you know it is unlawful to proceed with such work until a permit or amendament to a permit has been issued and in your possession. We therefore would like an explanation as to why you have proceeded with this work without authorization therefor.
- 2. While the plans filed with the application call for the concrete piers to extend up to the underside of the sills end girders of the platform, the piers have been brought up only to the grade level. What do you propose to use between the piers and the sills and girders for support of the platform?
- 3. It is noted that the wood posts supporting the roof of the existing platform have been built up of 2x8's of random lengths bolted together at top and bottom but only fastened with spikes in between and that in some cases there are cracks between the different layers of 2x8's wide enough so that daylight may be seen between them. These posts may be called upon to handle loads of considerable magnitude and the construction provided hurdly seems adequate or good from a maintenance standpoint. In construction of the new platform it will be necessary to have each 2x8 raking up the posts extend in one piece for the full length of the posts, to have the several members fastened adequately together other than by spiking and to devise some method of preventing penetration of moisture between the 2x8's to cause early deterioration. We shall need to know how this, is to be done and what is to be done to fasten the members of the existing posts together and to prevent misture from penetrating the cracks before the amendment may be issued.
- 4. It is also noted that machinery is being installed in the mill and that apparently preparations are being made to use it although the automatic sprinkler system has not been installed and work has not progressed far enough so that a certificate of occuparcy for use of the mill can be issued. It is necessary that the sprinkler system be installed and in working order before the building is put into use or k fore the certificate of occupancy may be issued. We have no record of any permit having been issued for the installation of this system. What arrangements have you made for its installation?
- 5. A ceiling has been provided over a small area of the mill although none is indicated on the plans filed with the application for permit for its construction. Is a ceiling planned over the entire area? If so its construction should be covered by an amendment to the permit giving information as to size and spacing of ceiling timbers and type of ceiling material. Installation of a ceiling will have considerable. bearing on the installation of the sprinkler system since it is likely that heads will be required above as well as below the ceiling. It is necessary that this

Lewis Lumber Company department make a "closing-in" inspection of the building before the erection of much a ceiling and no more work on it is to be done until authorization for its installation has been given by a green tag left at the Job.

6. Although it was specifically called to your attention in paragraph #5 of our letter of May 5, 1950 that the small exit coors at either end of the mill are required to be swinging not eliding, we find that a cliding doorles been provided for the exit at the easterly end of the mill. It is necessary that this door be replaced by a door at least 3' but not over 4' wide and at least 6' 4" high, which will swing and not slide.

Before the amendment covering the construction of the addition can be issued, it is necessary that full information be furnished as to how all of the above details are to be cared for. Until issuance of the emendment it is unlawful to proceed further with any part of the work covered by it.

Very truly yours,

Warron McDonald Inopestor of Buildings

Dear Mr. Adams:

Please note questions raised in paragraph #3 and furnish information as to whether you consider the construction of these posts adequate and if so, submit data supporting that contention; otherwise suggest what you would do to remedy the situation.

Warren McDonald

Gentlement

Amendment to building possit at 65 Bishop Street to cover change in cosign of the roef trusces over the open platform is issued, horewith, to the Swinge

Mr. Acams statement of design has been received and we are comrelied to rely wholly upon it since he has not shown on his clan the compicted stress diagram for both sides of this unsymmetrical truss.

It is not known who is to actually construct the trusces, but care must be used to use the correct edge distances from the toothed connectors to the edge of the member which it is to connect. This is especially in-pertant with the diagonal nearer the cantilevered end of the truss which is shown to carry 18,000 pounds, the largest stress in the entire diagram. These minimum edge distances should be secured from Mr. Adams, otherwise the connections will not be set the members connected.

It is equally important to use the correct distances center to center of the toothed correctors and where not shows on the plan should be secured from Mr. Adams.

I learned from the designer of the trustee that he is not responsible for the design of the foundations, he being involved only with the design of the trustee.

It is unfortunate that the coner has seen fit to put in all if these piers without having covered them with an amendment to the permit, they having been put in differently than authorized under the original posmit.

The owner's attention is called again to the figures in my letter of August 14 as to the unequal load on the sull for adjacent piers, piers under the trusses depositing about 3½ bone per square foot upon the soil beneath than while adjacent piers which support only the floor would deposite only about one ton per square foot on the soil. Such an inequality would probably not show up until such time as there was an extraordinary load of ica and snow on the roof.

Under these diremetances I am unable to include the new foundation piers in the amendment, and if difficulty arises due to unequal settlement, the owner will have to take responsibility for it.

Very truly yours,

W.cd/G

Warren McDonald Inspector of Buildings

"Inspector of Buildings"

BP 65 Bishop Street-2 (50/624) Amdt. /3

August 14, 1950

Engineering Services, Inc. 844 Stevens Avenue Portland, Maine

Copy to: Lawis Lumber Company, 65 Blohop Street

Centlemen:

With reference to your design of roof trusses for open platform of Lowis Lumber Company at 65 Bishop Street, will Mr. Adams be kind enough to forward his signed statement of design as per Section 104-b-3 of the Building Code to be attached to the design plan of the trusses.

I presume Mr. Weisberg for Lewis Lumber Company must have meant to include in his application for amendment for the change in roof trusses, the extensive changes from the original plan on which the permit was issued in foundation plans for the platform and for the trusses. I understand that these piers have already been built, though extensively different from the arrangement and plans indicated on the original plans. Hevertheless the piers must now be included in the amendment now applied for.

I do not know whether engineering dervices, Inc. designed the foundations or not, as they are now built, but their plan of these plans indicates, as I understand the plan that all of the plans are uniformed 2" diameter atom and a 20" x 20" footing 8" deep.

There has been some concern about the bearing capacity of the soil. In fact Mr. Lovis had the foundations redesigned, when the true character of the soil was known, so as to avoid future settlement.

It appears that the maximum reaction of each truss (on the end toward Bishop: Street) is indicated at 15,000 pounds or 7ktons, and that the posts supporting the trusses will come on every other paer or 12 from center to center.

It hardly seems possible that it would be attempted, but I see the rians, the footings of the common plans (those which would not support the trusses) would deposite about three tons or a little over one-ton per square foot on the soil beneath them while according to the figures on the plan for truss reactions, the footings of the plans under the truss reactions toward Bishop Street would deposite at maximum lead 10% tons or more than 3 tons per square foot upon the soil beneath them.

Will you be good enough to tell me wither where my figures are in error, or make some explanation of this extraordinary discrepancy?

Very truly yours,

Warren McDonald Enspector of Buildings

Mr. Benjamin Lewis Lewis Lumber Company 65 Bishop Street Portland, Naine

Cories to:
- Willer & Meal, Inc., 465 Congress Street
Bancroft & Martin Rolling Mills Co., 7 Main Street
South Fortland,

Dear Mr. Lewis

The percit for construction of a new planing cdll 70' x 96' on your property at 65 Bishop Street is issued herewith based on the plans of Filler & Beal, including details as shown on Sheet 3 bearing revision date of January 1, 1950, and the design of the trusses for roof of main building as indicated on plan of Bancroft & Martin Folling Hills Company bearing the date of January 13, 1950. Conditions under which the permit is issued are as follows:

- 1. While the plans call for a building 176' long, the partit is issued for only the westerly 96' of this overall length on your advice that this section is all you intend to build at this time. Construction of a building greater than 96' in length will call for another permit or an axendment to this permit if work under it has not been completed at that time.
- 2. The location of 'to build's on which the permit is issued is with the front wall 15' in from the line of Sisho; Street and the westerly wall 81' from the property line between 't Hawboldt property and yours, this being the location for which excavation has already been made and some of the forms for foundation walls have been erected. This will mean 'sat in order to keep an open criveway at least 20' wide next to the Hawboldt property line to give quick access to the existing mill on the rear of your lot as you have agreed with Chief Sanborn of the Fire Department you would do, the open platform with roof over it on the westerly end of the new building will be not more than 61' wide instead of the 65' shown on the location plan. The parmit is issued on this basis.
- 3. The front, rear and westerly walls of the building are to be supported on concerne trench walls extending at least four feet below grade, the easterly wall being the conditions are encountered, you will consult the architects as to the accquacy of the thickness of the wall as shown on the plans to spread the loads involved so as not to overload the particular kind of soil on which it is placed and will file an amendment to this permit covering any changes in design that may be necessary.
- 4. It is understood that the entire building is to be protected by an automatic aprinkler system. A separate permit is suable only to the installer is required for the installation of this system.
- 5. As indicated in red crayen on the plans, an exit door with platform and steps outside it is to be provided in the easterly end of the building near the rear wall. This door is well as the small door in the other end of the building is required to be at least 35° wide and 6° 4° high and to be swinging, not sliding. Vestibule lockeets so installed that the doors may always be opened from the inside even though locked against entrance from the outside by merely turning the usual door knob or by pressure on the ordinary thumb lever are required and are to be installed on each of these doors. An exit sign with latters at least six inches high is required over the door in the end of the building, towards Forest Avenue.

-

6. The platform outside the easterly exit door is to be at least 3' deep and wide enough to extend at least 9" beyond the door opening on each side. Sills of platform are to be no less than 4x6, all one pieco in cross section with the floor timbers no less than 2x4 spaced 16" on centers and supported either on top of the sills or on he less than 2x3 nailing strips spiked to the sides of the sills. Steps are to be at least 3' wide with risers not over 81" high and treads not less than 9" wide, measured on the points, and with a handrail on at lesst one side. Foundations of platform and steps are to be either cedar posts or concrete piers extending at least 4' below grade. If concrete piers are used they are to be no less than 8" square on the top and 10" square on the bottom.

- 7. Before the huilding is put into use, floor load signs of a persentent character, are to be displayed in consciouous places, these signs to indicate the maximum superimposis or live load which the floor is designed to support.
- 8. It is unlawful under State law to occupy the building upon completion until the certificate of occupancy has been issued by this department. Therefore as soon as all essential details of the building have been constructed, you are to notify this office for a "figal" inspection of the building men, if everything is found in compliance with law, the certificate of occupancy will be issued.

Very truly yours,

Warron McDonald Inspector of Buildings

65 Bishop Street Amendment #5 May 3, 1951 Lewis Lumber Company 65 Bishop Street Portland, Maine Gentlemen: Amendment # 5 to Permit 50/624 covering a 16'x 70' addition to the easterly end of the planing mill at 65 Bishop Street and additions to the loading platform on the westerly end of the building is issued subject to the following: 1. It is understood that the addition to the mill is to be constructed in the same manner as the rest of the building except that no roof truss is to be provided over the new end wall, which is to be built in the same way as the westerly end wall of the building.

- 2. The exit door in the present easterly wall of the building is to be moved to a similar location in the new end wall and the platform and steps cutside this door are to be set in place on foundations extending at least four feet below grade outside the new door opening.
- 3. The sprinkler system in the building is to be extended to cover the new addition.

Very truly yours,

Warren McDonald Inspector of Buildings

Inspector of Buildings

Al. 65 Mishop St.

December 19, 1949

Mr. Benjamin Lewis, c/o Lewis Lumber Co., 65 Nishop Street Portland, Maine

Subject: Application for permit to construct planing mill at 65 Bishop St.

Dear Mr. Lewis:

After checking the architects' revised plans we found that we could not issue the general construction permit because of lack of information with regard to the roof trusses.

Being mindful of the fact that both you and the architects had told me that you were anxious to get the foundation in on account of the approach of severe weather, I telephoned your office on December 9th, found that you were out of the city, and left the message that if you desired to get started at once, we could issue an advance permit for excavation and foundation only, but that in order to issue such a permit, you would first have to file application for it—suggesting that if possible you come in on Saturday morning, December 10th and file the application for the advance permit, whereupon it wouldbbe issued and you could start immediately.

You have not been in to file the application for advance permit, so that we could not issue it. When I mentioned the matter at the zoning hearing on Friday, you seemed to have some misunderstanding about it. This letter is for the purpose of clearing up any possible misunderstanding.

If you desire to come in and apply for the advance permit for excavation and foundation only, it will be issued to you immediately, whether I am in the office or not. We cannot issue the permit until it is applied for.

You will be notified shortly as to what information is missing with regard to the roof trusses.

Very truly yours,

WMcD/II

Warren McDonald Inspector of Buildings

CC: Hiller & Beal, Inc. 7465 Congress St.

Gentlemen:

With regard to the roof truss over the platform Mr. Mayo phoned that he desired to revise the details as regards connections. We have not received any revised plans as yet.

Warren McDonald

AF 65 Bishop Street-I

November 7, 1947

Lewis Lumber Company Attn: Mr. Benjamin Lawis 65 Bishop Street Miller & Beal, Inc. 465 Congress Street

Subject: Application for building permit for construction of mill at 65 Bishop Street

Gent lemen:

While we are awaiting the detailed plans and design data (bearing the signed statement of design of the designer) of the bow-string trusses which the architect says are to be designed and fabricated outside of the Portland area, also the name of the contractor, check of the plans discloses the following features which require decisions or additional information:

1. Construction of the proposed mill in the location shown again raises the question of approaches for the Fire Lepartment in case of fire in the present mill. Permit for enlargement of the present mill to its present area was issued on the basis of two good ways of approach for the Fire Department in case of fire. I've ways of approach building is sprinklered, beare required by the Building Code, even though the greates the area is so large and the baliding is of wooden frame construction.

After discussion with Mr. Levis and the Chief of the dire Department, it was agreed to accept the railroad right of way as one means of approach and the other from Bishop Street provided the owner would keep an open dilveway, wide encurn for the Fire Department apparatus to get through, adjacent to the easterly property line of the Hawboldt property to give quick access to the east end of the present mill. This arrange-Went did not show complete compliance with Building Code requirements, but was accoptable upon approval of the Chief of the Pire temartment. The Chief now feels that this verbal arrangement should be lived up to, that the driveway proposed on the east side of the proposed mill is not the equivalent of the one agreed upon and whit the proposed location of the mill should be energed or the open platform on the west and cut down so that the driveway of adequate winth agreed upon on the easterly side of the hasboldt property will always be available. The sener should decide which course to jursue and give us the revised location plan and also a written scatement that this priveway from Bishop Street and sufficient open area will always be kept open, free of obstruction, ardinat a width of open space, full length of the north site of the proposed mill between the proposed platform and the third building on the purporty occupied by others will always be kept open and available for maneuvering of/fire Department in case of fire in this third building which, I understand, is not sprinklered. This latter space between proposed platform and third building on the property scales only 35' which includes the railroad siding, which might have one or more cars on it in time of fire. I have talked this situation over with Chief Janborn, and it seems best for owner or architect to talk the matter over with him to arrive at some suitable adjustment satisfactor, to him. It may be that the proposed mill can be moved closer to Rishop treet.

2. Show an exit doorway at least 3' wide, swinging, in the east wall of the pro-posed mill, and necessary platfore and steps cataide; show that the door toward Sishop Street on the other end of the roll will be at least 3' wide, and that both of these will be equipped with vestibule latchests and with standard exit signs over them in such a position that all persons in the mill will know unstringly what direction to tale to reach either of these doors-not obstructed by piles of lumber or anything class. Boctions 2050, 212e2.5 and 4.

Lowis Lumber Company Miller & Beal, Inc. by gravity. How is the mill to be heated? Section 212h does not allow the warm air system. superetructure. Show depth of foundation walls and piers in fleures, and method of anchorage to foot, and we would like to have the conditions found by such and fores, and such for anchorage the conditions found by such and fores, the manufacturer furnish a written statement to be fabricated by welding, it is necessary that one of the procedure Society within one year field under the dealing of the shipped to avoid delay in erection of the shipped to avoid delay in erection of the after this written cortification from the welding field be in this written cortification from the welding them.

In the manufacturer in the best to be fabricated by welding, it is necessary to the work outside the procedure of the procedure of the procedure of the shipped to avoid delay in erection of them after the written cortification from the welding them.

In the manufacturer in the manufacturer to be fabricated by welding, it is necessary that the procedure of the welding that the shipped to avoid delay in erection of them after the written cortification of the them. - 4. This specification is to o asidered as such a part of the application for the assendent to the original peratt as though written upon the application fors, and failure to ention any requirement of the Building Gode berein does not repliete the omner or contractor from complying therewith.
- 2. Coltur becas at least 2x4 in size will be provided across every other pair of maft re in the second story rof.
- 3. The 4x6 knee braces supporting the 4x6 plates and 4x6 and 4x10 builtup girmor girders beneath the second floor will be supported at their lower ends by Alaces of 2m6 thoroughly spiked or bolted to the posts and that their upper ands by 2x0 thoroughly spiked or bulted to the underside of girts, plates, or girders and extending between the upper and of the pairs of lance braces supporting each given timber. (It is understood that this knee brace construction is not recommended by the Building Inspection Department especially where the knee braces are likely to produce an outward thrust on posts in the outside malie.)
- 4. The girts and center girder beneath the second floor level will be belved out and the corresponding posts in the second stary cut in such a samer that the second story posts will all rest directly upon the top of the first story posts and in the case of the corner posts, the first story posts will be cut and all arranged so that there will be a splice at least 18 inches in length where the corner posts in the second story join the corner posts in the first story.
- 5. If the second/is to be enclosed, at least 2x4 vertical stude leced not more than 16 inches from center to center will be used in the outside walls.
- 6. Refere the second floor of this building is occupied, a personant and conspicuous sign will be provided on the wall indicating the requesty of the floor por square feets

Mr. Francis J. braum, Sumborland Glub, 116 High Street, Portland, Maine

Doer Sire-

I have checked the plan of your proposed change in the storage building now under construction at the rear of Gl Bishop Street.

There are several details on the olan which are not very clear to me, and for your convenience I have written a brief specification which you may sign and thus make a part of your application for the maendacht to the parait and avoid making changes in the plan.

If you will sign this appointation and roturn to this office promptly we will issue the axendment to the permit.

Very truly yours,

McD/H CC: J. Everatt Low

Inspector of Buildings.

Original PERMIT ISSUED

Amendment N

AMENDMENT TO APPLICATION FOR PERMIT 1985

Portland, Maine,__ November 5, 1935 To the INSPECTOR OF BUILDINGS, PORTLAND, ME. The undersigned hereby applies for an amendment to Permit No. 35/1774 _pertaining to the building or structure comprised in the original application in accordance with the Laws of the State of Maine, the Building Code of the City of Portland, plans and specifications, if any, submitted her with, and the following specifications: Ross 81 Bishop Street -Ward 9 Owner's of Lessee's name and address Francis J. Brown, Comberland Club Contractor's name and address J. Everett Low, 1819 Forest Ave. yes Plans filed as part of this Amendment____ No. of Sheets. Increased cost of work 150. Additional fee Description of Proposed Work To erect one story frame addition app. 29' m 50' on west of shaving tower Foundation comercte piers, pitch roof 5" rise to foot, Asphalt roofing Ciass O Under-writers' Lab. corner posts 6x6 2119 115 - dirt floor, refters 1x6 INT on center Addition to be open shed for storage of baled shavings and lumber Chief of Fire Department. Commissioner of Public Works. INSPECTION COPY

File P.35/1774-I

Mr. Francis J. Brawn, Cumberland Club, 116 High Straut, Portland, Maine

Dear Sirs-

Referring to your application for an amendment to your building permit for a shaving tower at the rear of 61 Bishop Street, the amendment calling for n one story frame addition 29'm50', in order that I may tell whether or not the proposed addition will comply with Building Code requirements, planse put additional information on the plans which we have or let mo have the answers to the following questions:

Are the rafters to be dressed and therefore he reduced to about

five and five-eighths inches in depth?

Will there he any second floor?

If so, for what will it be used?

What will be the specing of the 2x6's shown across the building

anat will be the specing of the 2xu's shown across the builds at the level of the eaves?

What will be the size and spacing of the vertical stude?

For what are the 2xi's intended which are shown across the building on what is evidently a cross section on the plan?

Is either end of the building to be opened?

How is the roof or rafters to be supported at the end of the building at an acute angle with one of the sides?

Are the sills to be dressed on four sides thus cutting down their diffective strength?

The Building Code requires a minimum of 2x4 vertical stude spaced not more than 16 inches from center to center. If any nativial is to be stored in the building which would cause outward pressure on these stude, they should be larger on account of their 12 foot height. If you intend to use this studend to it is not clear what you gain by using so many 6x6 posts. Unless the rafters are to be full size 2x6 and spaced no more than 16 inches from center to center they are not heavy enough.

May we have this additional information promptly so that the permit

Very truly yours,

Inspector of buildings.

November 15, 1934 File Receipt 5304 B-I Mr. Francis J. Braun, Cumberland Club, 116 High Street, Portland, Maine Dear Sir: Findosed is a preliminary building permit covering excavation, foundation and superstructure except roof framing in connection with your proposed building at the rear of 61 Bishop Street. While the construction work, covered by this permit, apparently atis-fies the Building Code requirements, it seems only fair to call your attention to rather large inconsistencies in the floor framing. The design that you have submitted culls for 8x8 girders on eight foot spans and 5x10 floor joists on nine foot spans. The girders appear to be good for a total load of 90 pounds per square foot while the 5x10 joists are adequate to carry a load of 250 pounds per square foot. In other words the strength of the joists is almost three times the corresponding strength of the girders. Whether or not you desire to change the framing in order to make the two classes of members of more equal strength is not of great moment to this department, although a load of 90 pounds per square foot for the girders does not seem very large when the nature of materials and machinery that you are likely to store in the building is taken into account. By eliminating one line of girders, thus putting the 3x10 joints on a 12 foot span, and by increasing somewhat the size of the girdors you can eliminate one entire line of concrete piers and make the joints and girders of almost exactly the same carrying capacity at 140 pounds per square If you should desire to change this framing, please give the details as soon as possible. If we do not hear from you within a day or two we shall assume that you are going ahead with your own plans. The final permit will be available as soon as the roof framing has been checked and found satisfactory. Very truly yours, Inspector of Buildings. McD/H

STATEMENT ACCOMPANYING APPLICATION FOR BUILDING PERMIT for planing mill at app.65 Bi. hop Street In whose name is the title of the property now recorded? tollar 2. Are the boundaries of the property in the vicinity of the proposed work shown clearly on the ground, and how? Takes in line - 4 R.R. Thank. 3. Is the outline of the proposed work now staked out upon the ground? Yet If not, will you notify the Inspection Office when the work is staked out and before any of the work is commenced? 4. What is to be maximum projection or overhang of eaves or drip? 5. Do you assume full responsibility for the correctness of the location plan or statement of location filed with this application, and does it show the complete outline of the proposed work on the ground, including bay windows, porches and other projections? 6. Do you assume full responsibility for the correctness of all statements in the application concerning the sizes, design and use of the proposed building? 7. Do you understand that in case changes are proposed in the location of the work or in any of the details specified in the application that a revised plan and application must be submitted to this office before the changes are made? Yes.
