November 25, 1959

Mr. Charles A. Barrett
Long Island, Maine
Mr. Ashley Johnson
Chebeague Island, Maine

Gentlemen:

Building permit for construction of a one story addition 14 feet by 17 feet in front jog of dwelling at the above named location is issued herewith based on plan filed with application for permit but subject to the conditions listed below. If you do not understand what is meant or if you are not willing to provide the construction indicated, no work is to be started and permit is to be returned to this office for adjustment. Conditions under which permit is issued are as follows:

1. It is understood that, after construction of the addition, all of the doors in the existing dwelling will have at least one window which opens directly to the outside air.
2. On the basis of the use of 2x6 sills set with the 6 inch dimension upright no less than four concrete piers including the one at the corner are to be provided for support of the front wall of addition with at least three piers including the corner one beneath end wall. Extra piers may be used under wall of existing building to which addition is to be attached.
3. The 2x6 sills are to be all one piece in cross section (not made up of two pieces of 2x6), are to extend beneath the end wall as well as the front wall of addition, and are to be kept at least 6 inches above the surface of the ground.
4. Concrete piers are to be not less than 9 inches in diameter, are to extend at least 6 inches above grade and not less than 4 feet below grade or to ledge and are to have pins or dowels set in the top over which sills can be set for anchorage.
5. Corner posts and studs are to rest on top of the sills and not on shores on top of floor joists.
6. Floor joists are to be no less than 2x8 spaced 16 inches on centers instead of the 2x6 indicated in application for permit. Cross bridging of 1x3 or better bridging is required at center of span.
7. It is understood that the new pitch roof is to extend over the existing kitchen as well as the addition. On this basis the 2x6 rafters will be on a horizontal span of about 13 feet and will need to be spaced no more than 14 inches instead of 16 inches on centers in order to figure out.

Nov. 25, 1959

8. If clear span of header over picture window opening is to be 8 feet, header over opening will need to be no less than 4x10 hemlock or spruce. If opening is to be from 8 feet to 10 feet wide, a 4x10 header may still be used, but it will need to be of Douglas Fir lumber.

9. Foundation for outside fireplace chimney is required to extend at least four feet below grade or to ledge if that is found at a lesser depth. If walls of chimney are to be constructed with stone instead of brick around the tile flue lining, they are required to be no less than 12 inches thick.

10. Fireplace hearth is required to be supported independently of the floor framing and to project not less than 18 inches from the face of the fireplace as well as at least 8 inches beyond each side of the fireplace opening.

11. Ceiling timbers are to be no less than 2x6 hung to the roof framing at the ridge.

12. Notification is to be given this department for inspection before any covering is applied to inside of walls, the partitions or ceiling.

Very truly yours,

Albert J. Sears
Inspector of Buildings

AP Garfield Street, Long Island
(Frances G. Barrett)

Mrs. Frances G. Barrett
Garfield Street
Long Island, Maine

September 12, 1952

Dear Mrs. Barrett:

Copy to: Owner for contractor

Building permit to cover construction of 1-story addition to be attached to your dwelling on Garfield Street, Long Island is issued herewith, but subject to the following. We are enclosing a copy of this letter for the use of your contractor, and, if this letter is not understood, or, if you are unable to comply with it, it is important that you refrain from starting the work and contact this office for adjustment.

1. The 2x6 roof joists which the application shows as intended to be 16 inches from center to center are not strong enough, but would be if they are placed no more than 14 inches from center to center—this on the basis of information which you have given us that you plan to have a ceiling made of fibre board (Celotex). The Celotex Company also makes some heavier boards, and if it should turn out that you intend to use one of these heavier boards rather than the fibreboard, it would be well to tell us so because the 2x6s would probably not work out even if 14 inches from center to center, the 12 foot span being rather a long span for 2x6s on a comparatively flat roof.
2. It is assumed that the 4x6 sills are to be set with the 6 inches upright and that the foundation piers will be located and spaced as shown on your location sketch—a pier at each outside corner, one pier in the center under the 9 foot long end wall and one pier under the center of each 12 foot long wall. The sills are required to have the bottom edge no less than 9 inches above the finished grade of the ground, to have lapped splices at the corners, and to be anchored to the concrete piers by means of metal dowels or equivalent.
3. The floor joists must either get their bearing on the top edge of the sill or else be supported upon no less than 2x3 nailing strips spiked to the inside face of the sill. Since the floor joists are two inches deeper than the sill, it is likely you intend to bear them upon the top edge of the sill in some manner. The plate at the tops of the walls is required to be no less than doubled 2x4, and all window and door openings require doubled 2x4 headers over them, if of normal width, and a larger member if 4 feet or more in width. No less than 1x3 crossbridging is required in all of the floor spans and in all of the roof spans.
4. The contractor should bear in mind that he is not permitted to cover up any part of the inside of the exterior walls, or to cover up any part of the ceiling until notice has been given to this office of readiness for closing-in, and any electric wiring or plumbing involved has been installed and approved and until our inspector has left our green tag at the job.
5. In a habitation to be supported by piers, there is always the problem of closing in the space beneath the floor beneath the exterior walls. Foundation piers are put 4 feet below the surface of the ground so that they will

Mrs. Frances G. Barrett

2

September 12, 1952

not be heaved by the frost. Whatever construction is used to close in this space beneath the floor ought not to be in contact with the ground, otherwise you run the risk of the addition being heaved by the frost on this enclosing material.

6. It is assumed that you intend to use one of the usual weather proof coverings on the outside of the walls, such as clapboards or shingles. Any weather resistive covering which may be rolled up is not considered to satisfy the Building Code requirements for permanency.

Very truly yours,

Warren McDonald

Subject: Permit for construc-
tion of storage shed on
Garfield Street, Long Island

Dear Madam:

The permit for the above work is issued herewith. The use of this building is limited by the Zoning Ordinance to those allowable in the Apartment House Zone where the property is located. The storage of garden tools, screens, etc. is allowable as an accessory use to the dwelling on the lot. The keeping of poultry, however, is not allowable in this zone except by authorization of the Board of Appeals.

Very truly yours,

Inspector of Buildings
